Mr. HARDCASTLE proposed a vote of thanks to Mr. Smith for his paper. He said that while Professor Ryland had indulged in strictures against architects, that gentleman, in stating the three requirements which to his mind were of paramount importance in the erection of a scientific museum, had lost sight of the public. First came the wants of the curator; second, of the teacher; and third, of the students. The general public were not mentioned at all; they were nowhere. This indifference to the requirements of the public was illustrated at the Natural History Museum by the fate of the refreshment-room, which had now given birth to an abortive lecture-room. Any defects in the arrangement of that museum were due to the piecemeal way in which the building had had to be carried out. It reflected much to the credit of those connected with it that they had tried to make it as interesting as possible to the general public. The exact opposite, however, seemed to be the case at the British Museum, and seemed not unlikely to follow at South Kensington Museum. Fancy having to go prowling about outside for refreshment! and seeing that the architect had arranged a room for the purpose, he thought it was censurable that it should have been struck out, and a very bad lecture-room made instead. At least as much consideration should be given to the requirements of the public as to any other. In addressing young men who might perhaps make acquaintance with these buildings through competition, he might mention that the ordinary town councillor would be apt to think more of the requirements of the public than those of the curator.

Mr. STANNUS, who seconded the vote of thanks, speaking of the South Kensington Buildings, and the remarks on the tentative way they had been put together, called to mind the difficulties which

had attended its erection in face of the pitiful allowances which had been doled out piecemeal for carrying on the work. He admired the indomitable force of character displayed by Sir H. Cole. He was a great man, and one who was determined to have his way; and though his conduct might at times have assumed angular forms, it was plain to see that, had he not put his foot down, and kept it down, we should not now be in possession of the magnificent collection at South Kensington. No fault would be able to be found with the building, the classification of the collections, &c., when all should be completed.

Mr. GOTCH recommended those who might have the designing of any such buildings in future not to adopt the lofty scale of the reading-room at the British Museum. A student might as well be in the open air at once, such vast atmospheric storms were generated within it. He advocated a more thorough system of local museums, as were found abroad, where no town of any pretensions was without its museum, and apart from objects of more general character, valuable collections of local interest and antiquity were found in them which would not otherwise have been preserved.

The vote of thanks was then put from the chair and passed.

Mr. SMITH, in the course of his reply, mentioned that heating-coils were placed below each of the windows of the reading-room in the British Museum, for the purpose of counteracting the draughts, and certain of these were put in operation according to the direction of the outside wind. Sometimes the wind would chop round to an opposite quarter, and then as speedily as possible other coils had to be put in operation, to meet the sudden change.

METROPOLITAN IMPROVEMENTS.

AT the meeting of the Metropolitan Board of Works the report of the Finance Committee on the work of the Board during the year ending on December 31, 1882, was presented and adopted. It first dealt with the formation of new sewers to carry off the overflow of storm water, the construction of which was rendered necessary by the floodings to which various districts of London had for some time been subject when heavy rain occurred. The two new sewers from Clapham to Vauxhall Bridge and from Kennington Church to Vauxhall Bridge, with outlets into the river at the last-mentioned point, the construction of which was begun in the year 1880, were completed last October. These two sewers, which together are about 12,200 feet in length, are intended to relieve the southern high level sewer in times of heavy rain, and to carry off the storm waters into the river at Vauxhall. The contract price was 65,500*l*. In August last a contract was entered into for the formation of a sewer from Roehampton Lane, Putney, to Clapham, 27,876 feet, or about five and a quarter miles in length, the size of which will vary from 4 feet 6 inches by 3 feet to 9 feet by 6 feet; also of branch sewers to be connected therewith from Battersea Rise, Nightingale Lane, East Hill, Wandsworth, Wimbledon Park Road, the Putney Boundary Sewer, and the river Wandle respectively. The total length of these branch sewers will be 14,280 feet, making, with the main line (of which a length of 2,064 feet will be carried by means of an aqueduct across certain low-lying lands at Wandsworth), an aggregate length of 42,156 feet, or about eight miles of new sewers. The amount for which the contract was taken was 151,995*l*. 19*s*. Another important item in the report is in respect to the Barking and Crossness outfalls into the river Thames, and the report states that the Board had resolved to enlarge the reservoirs at these outfalls, to about 50 per cent. beyond their present capacity, so as to admit of the largely-increased quantity of sewage being stored in the reservoirs until the ebb tide, and thus obviate the necessity of allowing any portion of the sewage to be discharged at flood tide, as has been necessary on some occasions to permit. The specification and drawings of the works at both reservoirs were accordingly prepared, but, pending the result of the inquiry by the Royal Commission which has been appointed to inquire into and report upon the system under which sewage is discharged into the Thames by the Board, the works have not been put in hand.

The state of the Thames was next alluded to. It had been stated that it had become polluted by the discharge of sewage into it, and accordingly a Royal Commission was appointed "to inquire into and report upon the system under which sewage is discharged into the Thames by the Metropolitan Board of Works; whether any evil effects result therefrom, and, in that case, what measures can be applied for remedying or preventing the same."

With regard to the Thames Floods Prevention Act, in the year 1881 the Board prepared and served upon the owners plans, sections, elevations, and estimates of what was necessary to raise to a height of 5 feet 6 inches above the Trinity high-water mark the level of the walls and open river frontages in Westminster, Chelsea, the parish of St. George, Hanover Square, Limehouse (part), St. George's-in-the-East, Lambeth, and the districts of St. Saviour and St. Olave, Southwark. During the past year the plans and notices have been served upon the owners in Bermondsey, parts of Rotherhithe, and part of Wandsworth; those for a further portion of the Limehouse district have also been prepared,

and will be served forthwith; and those for the remaining portions of the Limehouse and Rotherhithe districts, and for parts of Greenwich and Fulham, are in a forward state of preparation. The plans, &c., already served upon owners have reference to the total number of about 500 wharf and other riverside premises. Of these about 450 have either complied with the Board's requirements, or executed modified works in place thereof, and the works are now in progress at several of the remaining premises.

As regards the improvement at Hyde Park Corner, the Board, having carefully considered the proposal of the First Commissioner, came to the conclusion that it offered the most practicable and convenient method of providing increased accommodation for the traffic in a part of London where such increased accommodation was most urgently needed; and, recognising the force of the First Commissioner's argument, that, as the improvement would be for the benefit of the metropolis, the main portion of the expense might properly be made a metropolitan charge, the Board agreed to contribute the sum of 20,000*l*. towards the cost of the works. The Board had previously satisfied itself that the improvements in the public thoroughfares would not cost less than this amount, and that the Board's contribution would not include any part of the expense of the proposed removal of the Wellington Archway, which it was thought should properly devolve upon the Government. A clause was inserted in the Board's Money Act of last year, authorising a contribution of 20,000*l*. towards the cost of the improvement, which is to be carried out under the direction of the First Commissioner of Her Majesty's Works. The works are now being proceeded with.

With respect to Hammersmith Bridge, it was proposed to make the carriage-way 8 feet wider, and to add 1 foot 9 inches to each of the footways. Tenders for the execution of these works were invited, and in August last a tender was accepted for 74,920*l*. It will, of course, be necessary to close the bridge during the execution of these works, and it was originally thought that it would be sufficient to provide temporary accommodation for foot passengers only. It was accordingly proposed to provide two large ferry-boats to cross the river from side to side at frequent intervals. When the inhabitants of the neighbourhood ascertained what was intended, they made strong representations to the Board in favour of providing accommodation for vehicles as well as for foot passengers, and for this purpose they asked that a temporary bridge might be erected. The Board, having considered the representations made to it, was of opinion that the request of the inhabitants on each side of the river in the neighbourhood of Hammersmith Bridge was a reasonable one. The Board's legal adviser, however, was of opinion that the Act of Parliament, which empowered the Board to acquire and maintain bridges, did not give power to erect a temporary bridge, and to make approaches thereto, as would be required. The Board, therefore, resolved to apply to Parliament for power to alter and improve the old bridge, and to make the temporary provision required. As to an improved communication between the two sides of the river, there had been a conference between the Corporation of London and this Board; the engineer's report was still before the committee for consideration, and they had not come to any conclusion upon it.

As to open spaces, during the year the Board had acquired for the use of the public three more open spaces, by which about seventy-two acres had been added to the total area of open spaces previously under the control of the Board. They were Peckham Rye, Goose Green, and Nunhead Green.

The report next referred to the different public improvements which have been carried out during the past year, and the sums of money spent on the different parks under the control of the Board, and also for the improvement and consolidation of the Fire Brigade. A great number of other matters were also referred to in the report, in concluding which the Board is glad to be able to state that there is at least some prospect of the formation of the two new streets at the West-end of London, which were authorised by the Metropolitan Street Improvements Act of 1877, and which are intended to furnish direct access from Charing Cross and from Piccadilly Circus to Oxford Street and Tottenham Court Road. It has been often pointed out that the delay in the formation of the new streets has been entirely owing to the impracticable conditions imposed upon the Board by Parliament with respect to the provision of other dwellings for the people of the working-class to be displaced by the improvements. The Board has at length, after many efforts, succeeded in convincing both the Home Secretary and Parliament of the absolute necessity of modifying these conditions if the new streets are to be made. A Bill which is to come before Parliament will provide for the necessary modifications, and, as soon as the Bill is passed, no time will be lost in proceeding with the improvements.

A Hygienic Exhibition was opened in Berlin on the 10th inst. The building covers an area of about five and a half acres, and there are two thousand exhibitors.

Signor Giambastiani, an Italian engineer, has prepared designs for a bridge over the Straits of Messina. It is to be of steel, and three miles in length.

that their doors open into it. This is the most compact arrangement, and it is capable of being carried out without detriment to the general design, for even with two storeys of class-rooms, the large schoolroom can be lighted over them.

Open fire-grates have already been recommended as the most agreeable mode of warming the class-rooms; and we suggest that they should have double-opening sash windows, doors with glass in the upper panels to allow the superintendent to look in without opening the door, and that the walls, instead of being plain colour-washed, be papered and varnished, and further relieved by maps likely to be useful in elucidating the lessons. Benches, with backs and ends, occupy less space than chairs, and may be made quite as comfortable. It is possible to carry the idea of making the rooms into sitting-rooms too far, and to expend money in things which are not suitable for general use, and which only look well while they remain unsoiled.

Infants' Class-room.

The infants' class-room should be placed so that its teacher never has the slightest fear of disturbing the general school. When this class takes the place of one of the ordinary classes in the school, the teacher cannot conduct it with the necessary freedom; and when it has its own place in the large schoolroom from which all the other classes retire into small rooms for teaching, it is obliged to conform to the general exercises of the school, which have perhaps no interest for it, and it cannot be independently dismissed. There is no better way of arranging the scholars than by placing them in a gallery, tier above tier, giving them an unstrained view of the teacher and the lesson-board. The width of the gallery stages, including the seats, should not be less than 18 inches from front to back. The rise from one stage to another should not be more than the height of the seats, and there should be an allowance of 14 inches for each child, measuring along the seat after taking off a passage or gangway up one end, or at both ends if the gallery be a long one. The length of the gallery from end to end should not be greater than will allow of its being easily commanded by the eye of the teacher. The seats should have backs to support the young children in an easy sitting posture, not mere rails under which those in the row behind can push their dirty shoes, to the detriment of juvenile clothing, but a sloped board from the back of the seat, rising only so high as not to cramp the elbows.

There may be a blackboard, 2 feet 6 inches deep, fixed about four feet from the floor, along the wall in front of the gallery; also an ordinary blackboard on a movable frame, and an object-table.

Sunday schools should be "pleasant places," and the infants' room should be the pleasantest of all.

A side light is the best for the gallery, so that neither the scholars' faces nor the lesson-board are in the shade; a top light is the next best, and may be adopted as an auxiliary or corrective. There must be an abundant supply of direct light to this room to promote its general cheerfulness, as it is in many cases the introductory class for scholars, and "first impressions" are not easily eradicated.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of this society was held on Monday.

The first paper was a notice of a representation of St. George at Fordington, in Dorset, and of a similar representation, probably also of St. George, at Linton, in Roxburghshire, by Sir Molyneux Nepean, Bart., F.S.A. Scotland. After referring to the history of St. George and what was said of him prior to his becoming the patron saint of England, and describing the church of Fordington, which was dedicated to St. George and endowed with the church of St. George at Dorchester by Osmund, Bishop of Salisbury, in 1091, Sir Molyneux exhibited two sketches of the group of figures carried on the tympanum of the doorway. The first of these was from a drawing made about one hundred years ago, and the second from a photograph representing the sculptures as they now appear. The group represents an armed figure or knight on horseback, riding down and destroying the heathen. A nimbus surrounds the head of the rider, and a cross appears on the banderole of his lance. The figures of the conquered heathen are in conical helmets with nasals. The style and treatment of the sculpture was curiously archaic, and there could be no doubt that it represented St. George, and was intended to symbolise the triumph of Christianity over Paganism. On the tympanum of the doorway of the church at Linton, in Roxburghshire, there is a curiously similar sculpture; the knight in this instance, however, is represented as slaying a monster. A sketch of this group also was exhibited, and for comparison with some of the representations on the sculptured stones of Scotland, Sir Molyneux showed a drawing of an angel from the church of Hinton Parva, in Dorset—a very rude and early example of Saxon art. In the second paper, Professor Duns brought before the Society a number of characteristic specimens of the sculptured slabs found in the churchyards of the island of Mull, of which he exhibited rubbings along with full-sized drawings made by Mr. Thornton Shiells,

architect, F.S.A. Scot. Professor Duns also called attention to certain features of the decoration of these slabs, which probably exemplified the transition from the pure Celtic style to the degraded style of the West Highland slabs. Mr. Symington Grieve, in the third paper, gave an elaborate account of the "crystal spring cavern in Colonsay," explored and previously partially described by him. In the next paper, Rev. William Lockhart, M.A., F.S.A. Scot., gave some notices of the early history of Colinton in connection with the church of St. Cuthbert of Hala, by which name it was known when it first appears on record, somewhere about 1095. After referring to the grant of the church of St. Cuthbert to the church of the Holy Trinity at Dunfermline by Ethelred, second son of Malcolm Canmore, the author stated that it was now impossible to fix the exact date of the erection of the church at Hala, but Chalmers places its site on the spot now occupied by the mansion-house of Hailes. In the year 1226 the church was a rectory, and about this time there was a dispute between the church of St. Cuthbert's at Hailes and the church of St. Cuthbert's beneath the castle of Edinburgh regarding the tithes of the Craigs of Gorgie, in which the Abbot of Lindores and the Prior of St. Andrews were constituted umpires. Many other notices of the church occur in the chartulary of Dunfermline, and although no vestige of the structure itself now remains, it is interesting to trace the beginnings of the parish and the incidents of its pre-reformation history from these old documents. The last communication was a notice of the occurrence of a sepulchral chalice and paten of lead in a grave in Bervie churchyard by Rev. J. Gammack, Drumlithie, hon. mem. S.A. Scot. These articles were found in digging a grave near the south-east corner of the ruined old church, at a depth of 5 feet. The chalice had been standing on the paten, apparently with the mouth downwards. The practice of placing such sacerdotal insignia in the graves of ecclesiastics is well known, but in Scotland examples of the actual relics are scarcely known. The gift of this chalice and paten to the National Museum, which is due to the intelligent interest and kindness of Rev. John Brown, M.A., minister of Bervie, is an important contribution to a little-known class of national relics. Two large and interesting collections from the lake dwellings at Buston, near Kilmaurs, and Lochspots, near Kilkerran, Ayrshire, described by Dr. Munro in his recently published work on the "Lake Dwellings of Scotland"—the former presented to the National Museum by the Earl of Eglinton, and the latter deposited by Sir James Fergusson, Bart., of Kilkerran—were exhibited to the meeting. A large number of other donations were announced.

THE "LADY TORFRIDA" YACHT.

A NEW field is being opened for architects in connection with naval architecture. The saloons and living rooms in vessels are of as much importance as corresponding rooms in houses on land, and there is a corresponding necessity to have them decorated in artistic style. Hitherto the decorations have rarely deserved to be so considered. Messrs. Elder & Co., the well-known ship-builders of Govan, have done much towards the introduction of art into steamers. The saloons in the *Livadia*, which was constructed by them for the Emperor of Russia, were decorated according to designs which were prepared by Mr. William Leiper, F.R.I.B.A. An illustration of one of the rooms was published at the time in *The Architect*. Mr. William Pearce, who is head of the firm of Messrs. Elder & Co., has had a new steam yacht constructed for his own use. It was launched a few days ago, and is considered to be the most perfect vessel of its class which has been built on the Clyde. She is 200 feet 8 inches long, 25 feet 7 inches beam, and 15 feet 7 inches deep, and her tonnage is 610 4-94. Mr. Edward Howell, architect, of Glasgow, was entrusted with the commission for the decoration, and the following description of the work which has been carried out under his direction is taken from the *Glasgow Herald*:—

The deck saloon is floored with parquet in various woods, the seats are cushioned in red morocco, a table being placed at the further end. The main saloon is a luxurious and commodious apartment, lofty and well-proportioned. The fittings and carvings, designed in the style of the Italian Renaissance, are of dark mahogany, artistically grouped and separated by gilt pilasters of a highly ornate character. The wall panels are covered with silk brocatelle in shades of terra-cotta and olive. Oil paintings on gold leather grounds, representing ancient galleys, conventionally treated, are placed two on either side of saloon, in the centre compartments. A pleasing effect is obtained by enclosing the side-lights with elliptically-formed bays, filled with leaded stained glass which are illuminated at night by a lamp placed inside. Two lamps of elegant design are suspended from the ceiling, which is panelled with mouldings into octagonal forms and appropriately decorated. The furniture consists of a sideboard, book-case, two tables, piano, sofas and chairs, the latter being covered in golden olive velvet. Panels of hand-painted tapestry, in Louis XVI. style, are fitted into the backs of piano and writing-table, and form a pleasing decorative feature in the saloon. The portières, which were specially made in Paris, are of grey-blue

satin, richly embroidered after the manner of old Persian work. The Axminster carpet, made in one piece, is of Persian design on gold ground. A brass stove, chastely ornamented, completes the furnishing of this beautiful apartment. Aft from the main saloon are situated the ladies' cabin and owner's room. The fittings of the former are of walnut, the lower panels being carved in Italian scroll and foliage work. The upper panels are of hand-embroidery on gold satin, showing a continuous floral design. Surmounting this is a pale-blue satin frieze, over which the design of embroidery extends. This apartment is furnished with wardrobe, writing-table, sofas and chairs in blue velvet and gold silk damask. Two ivory panels in a hall cabinet specially attract attention from the beauty of the carvings, the subjects being "Night and Morning." Tapestry curtains of gold colour, with trellis fringes, enclose the berth couch, and the harmony of the whole is sustained by the rich crimson of the carpet. Adjoining this cabin a bath-room is provided, most complete in its arrangements. The owner's room is fitted up in a manner equally artistic, the walls being panelled with exquisite silk Genoa velvet of floral design, on ivory ground, in framing of brown oak. Olive silk plush curtains, with border of rich French applique work, drape and screen the couch bed. A large writing-table with ottoman seat occupies one side of the room, a mirror being placed above. The carpet is Axminster, in shades of golden olive, and curtains of velvet are placed on the side lights. A handsomely-fitted bathroom is connected also with this cabin. From the main saloon is a corridor, on either side of which are the guests' state-rooms; of these six are forward and two aft. These state-rooms are thoroughly ventilated, and furnished with a careful regard to comfort and convenience. The fittings are mahogany, panelled with Venetian decorated tapestry, gold colour silk curtains, fringe draperies and velvet carpets. A smoking-room is provided at the after-end of deck-house, floored with parquet, and comfortably seated.

NEW ZEALAND TIMBER SUPPLY.

THE United States Consul at Auckland, writing on the trade and industry of New Zealand, says it is estimated that the forests of New Zealand cover an area of not less than 20,000,000 acres, the forests on the Crown lands alone being estimated at 10,000,000 acres; about 5,000,000 acres are the private property of the white or European population, and the remainder is by the Maori, or native inhabitants. Among the many descriptions of timber grown, the *Kauri* pine is considered one of the most valuable; it is found only in the province of Auckland, and in that district it does not exist further south than the East Cape, and, like the cedar, it is confined to the vicinity of the sea. The *kauri* forests cover about 60,000 acres of Crown land, and about 120,000 acres of private property. The trees often grow to a height of 200 feet, and measure from 12 to 30 feet in circumference; they are discovered occasionally with a rugged surface, and on being cut, the grain is found to be mottled. The *kauri* is exported largely in what is called "junk," the logs being squared with an axe, thus wasting a quantity of good timber. The annual output of *kauri* timber is about 110,000,000 feet, and the highest estimate of the amount of timber left in the *kauri* forests is 23,000,000,000 feet. The subject of conserving the *kauri* forests is at the present time attracting considerable attention throughout the colony, not only on account of the excellent timber it produces, but on account of the gum which exudes from the tree, and which for many years has formed the most valuable article of export of the province of Auckland. Next to the *kauri*, the *Kahikatea*, a species of white pine, is the most highly prized. It grows in the low lands in the vicinity of rivers. There is an immense forest of these trees between the Thames and Piako rivers, thirty or forty miles in length, and several miles in breadth. The *kahikatea* is found in the *kauri* districts, and but little attention is paid to it, notwithstanding the fact that its value, as a timber for building purposes, is becoming very generally known. *Potara*, a hard close-grained wood, is largely used in the south of New Zealand; it is a good sound timber, reddish in colour, and very durable. It is largely used for telegraph poles, and has attracted much attention during the last few years, from the fact that it will withstand the disastrous ravages of the *Teredo navalis*, a sea parasite, common to the islands of the Western Pacific. *Puriri* is another hard durable wood; it is largely used in the construction of railway trucks. This wood is said to make excellent furniture, though it is not much used for this purpose. Another very valuable timber tree is the *Maire*, a native olive. It is hard, oily, and close-grained. *Pohutakawa* is a coast variety of a tree used for shipbuilding. This tree is one of the best known in New Zealand; large branches of it, bearing beautiful brush-like red flowers, are everywhere cut at Christmas for the purpose of decorating houses and churches. It affects rocky cliffs, its leaves are large and thick, of a greenish-blue colour on the outside, and the inside perfectly white. The trunk is gnarled and twisted in every direction. The inland variety of this tree is called the "rata," and there is a curious growth clinging to the rata, which has been the cause of much speculation among scientific men. It has not yet been decided whether it is deposited

as a seed in the forks of high trees, or whether it creeps up from the ground like the ivy. It is found as a mere thread on the trunk, and thickens and sends out side shoots, and intertwines, as the ivy intertwines the oak. In time, the large tree perishes, and the frail slender growth stands alone, with its arms outstretched, embracing the circular space where its supporter formerly stood, and the stems that have grown around and about the same supporting tree will unite and form one hollow rata tree, with bark inside and out. Among the other better-known New Zealand trees may be mentioned the *Kawaka*, *Matai*, *Tanekaha*, *Rawiri*, *Manoas*, *Kowhai*, *Miro*, *Hinau*, *Titoki*, *Horopito*, *Manuka*, *Pahautea*, and *Tawai*. The number of saw-mills in the colony is steadily increasing, and it is estimated that there are 250 at present in operation, while in 1879 there were only 204; and at that time Mr. Levy, in a report to the New Zealand Government, estimated the yearly supply from each of these mills at 1,000,000 superficial feet, or about 200,000,000 superficial feet as the total annual product. It appears from the statistical returns of the New Zealand trade, that the value of timber exported in 1881 amounted to 77,000*l.*, against 53,600*l.* in 1880.

IMPROVEMENT OF SCOTTISH BURGHS.

A BILL has been introduced by the Lord Advocate, which bears the title of "The Burgh Police and Health (Scotland) Bill." It consists of 623 clauses, and provides for the formation and constitution of burghs on the grounds that "it is expedient that the whole area occupied by an urban population, and forming one continuous urban district should be under the administration of one local authority for police and sanitary purposes. General improvements are to be carried out at a cost which is not to exceed 2*d.* in the 1*l.* of rental. One clause provides that the Commissioners may at a meeting to be held for the purpose resolve to acquire lands or premises within the burgh for the purpose of widening, enlarging, or otherwise improving any of the streets; and they may also drain, repair, or otherwise improve courts and places where there may be doubt as to the liability of owners to execute such works; and in localities where houses or other buildings are, in the opinion of the Commissioners, built too close to each other, or have become waste and ruinous, or are liable to other objections on sanitary grounds, it shall also be lawful to the Commissioners to acquire lands or premises for the purpose of reserving them as vacant spaces, or of improving the buildings, or of otherwise disposing of them so as to improve the sanitary condition of such localities."

With regard to building regulations, it is provided that in burghs where there is a Dean of Guild Court the procedure as to passing plans and obtaining authority to erect new buildings and lay out streets, &c., is very similar to that presently in force in Glasgow. In burghs where there is no Dean of Guild Court the commissioners take the place of that body. Clause 214 provides that "every building erected for the purpose of being used as a dwelling-house or any building not previously used as a dwelling-house, when the same is altered for the purpose of being so used, where all the rooms are not lighted and ventilated from an adjoining street or other open space of not less extent than the area of the building, shall have directly attached thereto, in the rear or at the side thereof, an open space exclusively belonging thereto, equal to at least three-fourths of the area to be occupied by the intended building, such space to be free from other erections." The clauses devoted to the regulations applying to buildings are numerous, and deal with many matters of detail, such as limiting the number of houses in common stairs, the height of ceilings and windows, excavations, drainage, ventilation, supplying proper lighting, and sufficient ingress and egress to public buildings, &c.

"Chimney-piece, Cragside."

SIR,—In your notice of the drawings in the Royal Academy I see you credit me with the draughtsmanship of the *Chimney-piece at Cragside*. It is, as you truly remark, one of the finest pieces of drawing in the room, but it is not mine, but wholly the work of Mr. Wm. R. Lethaby, whose name you will find on the drawing.

Yours faithfully,

R. NORMAN SHAW.

The Architectural Room at the Academy.

SIR,—If, in the old adage, there is any force, "When things get to the worst they must mend," the time, one would think, has arrived when architects should be better treated at the Royal Academy. From the large number of drawings submitted and the small number selected, the thought was natural that none but very

meritorious work had been chosen. How many of the favoured works fall short of that ideal I leave others to determine. The space allotted, too, is unfairly small, and that which has been squeezed out is not sufficiently utilised. Then, again, why has the centre screen been removed? Had that remained, more wall space would have been left for exhibits. In fine, I may say that a wretched fiasco has been made of the whole thing, comparable only to the perspective blunder made by a distinguished exhibitor, who has drawn two large figures in the foreground of his picture, and about twenty or thirty feet off represented an old couple who ought not (if truth be told) in the flesh be more than forty-two inches high.

I am, Sir, your obedient servant,
PERSPECTIVE.

SIR,—What must the general public think of the present state of architecture after an inspection of the miserable show under that head at the Royal Academy?

It is a gross libel on our profession to suppose that the designs hung are a fair selection of those submitted, or that they represent the taste of the country, and such an exhibition as the present one is calculated to bring architecture into contempt.

The space formerly allotted to architectural designs has this year been considerably encroached upon by figure subjects, while the centre screen is altogether omitted, and designs for wall decorations and stained glass (two of the latter being large, real size cartoons), together with many sketches of old work help to fill this greatly-reduced space, which for years architects have justly complained of being too contracted for the chief of the arts to be fairly represented.

I have heard it stated by a reliable authority that there was no architect on the hanging committee; yet there are two Fellows and three Associate members of the R.A. all of our profession. If it is not in the interest of the above gentlemen to see their own profession fairly represented each year at the R.A., it surely behoves the R.I.B.A. to do so before architecture becomes a by-word and is ousted altogether from Burlington House as a nuisance. It were better this than that architecture should come to be chiefly represented by cartoons for stained glass and sketches for the decoration of our buildings, however clever they may be.

Architecture surely deserves better encouragement than it at present receives at the hands of the Royal Academy.

Believe me to be, yours faithfully,
A PROVINCIAL F.R.I.B.A.

ARCHÆOLOGY.

The Ashburnham Manuscripts.—A correspondent writes to the *Times*: "It is understood that the negotiations between the trustees of the British Museum and the Government respecting the purchase of the Stowe and Appendix collections of the Ashburnham library have advanced so far that it only remains to adjust a difference of valuation. The Government recognises the desirability of adding these two important collections of manuscripts to the national library, and it is to be hoped that it will see its way to accepting the terms on which the purchase can be effected. At every sale of books, manuscripts, engravings, or works of art, we see keen competition among collectors and large prices given for rare or fine specimens; and too often the limited means placed at the disposal of our public museums are too puny to do battle with the large sums which private enterprise can bring into the field. It is a fallacy, therefore, to imagine that such finely illuminated and other rare manuscripts as form so important a part of the Ashburnham collection can be picked up any day in the market. When an opportunity like the present occurs of securing a collection of works of art and valuable historical documents, it is a wise, and in the end an economical, policy to seize it. The nation never grudges paying a handsome price on such an occasion."

CHURCH BUILDING AND RESTORATION.

Battersea.—A new church in Albert Road, adjoining Battersea Park, dedicated on Saturday last, is the fifth church designed by Mr. William White, F.S.A., at Battersea, for the Rev. Canon Erskine Clarke, vicar. It has been planned on a large scale, the extreme dimensions when finished being 180 feet in length and 105 feet in breadth externally. The part now completed consists only of a portion of the chancel and south chancel aisle, which is eventually to serve for vestries. The sanctuary is separated from the chancel by a lofty arch. Both the chancel and its aisle are terminated eastwards with an apse, and around the apse of the chancel is an ambulatory with an arcade of five arches, over which rise five lofty lancet windows. These windows, however, are only two-thirds of the height originally proposed, the design having been materially reduced on account of cost. There is a clerestory of two single lancets on each side of the chancel, each of them contained within a double-arched curtain rib. On either side of the sanctuary arch is a small arch connecting the chancel with the ambulatory, and over it is an open arcade connecting the sanctuary

with the chancel. The walls and windows generally, the arches and piers, are built of brick, with special made mouldings, stone being used for the pillars, carved caps and bases, some bands across the brickwork externally, and a few minor details. The several kinds of stone used are the red Dumfries, the yellow Ham Hill, the green Wardour, and buff Chilmark. A corbel table is carried round beneath the eaves of the roof. The ambulatory roof is vaulted in brick. In order to provide present accommodation for 400 persons, a temporary annexe has been built on to the west, and another to the north. The former is fitted with deal benches, which are proposed to serve for the permanent church, the remainder with chairs. Large accommodation is provided for the choir. The brick bases of columns at east end show the future finished level of the floor, which will rise altogether twelve steps from the nave. The depth of foundation below the floor level is from 12 to 14 feet. The plan comprises a future "chapter-room" to the north-east for parochial and mission uses, conferences, and other purposes connected with the church.

SCHOOL BUILDINGS.

Acton.—The Priory Board Schools, erected in Acton Lane by the Acton School Board, accommodate 300 boys and 300 girls; the schools and class-rooms are all on the ground floor, and are arranged around a central hall or covered playground. The exterior of the building is of stock brick, with red brick and Beer freestone dressings, in Queen Anne style; the roofs are slated. The interior of the schools and class-rooms is finished with pitch pine dado, the upper part of walls being plastered; the central hall or covered playground has glazed brick dado, about 5 feet high, of chocolate and black, with moulded black capping, the upper part of the walls being faced in white Arlesley bricks with red brick strings, arches, and moulded courses. The roofs throughout are of pitch pine, stained and varnished. The central hall is 80 feet by 40 feet, and about 40 feet high to the ridge of the lantern; it is lighted by twenty clerestory windows, and has a lantern running the whole length of the roof with side lights only, half of which are hung for ventilation. On either side of the hall are five large openings, which run right down on to the floor, are filled with pitch pine revolving shutters, executed by Messrs. Salmon, Barnes & Co., of Ulverston. These ten shutters can be raised and the schoolroom thrown into the central hall, by which means a room 80 feet square can be obtained. There are four entrances to the schools, two for boys and two for girls, so arranged that the children may enter or leave either of the schools or class-rooms without interfering with any other room. There is also a separate entrance to the front of the central hall, and from the lobby is a staircase leading to the Board room and committee room. The central hall and schools are warmed by hot water at low pressure from an "Excelsior" boiler. The class-rooms and the Board and committee rooms are warmed by Manchester grates, by which a current of warmed fresh air is admitted into the rooms. The heating has been carried out by Messrs. Leggott, of Bradford. The buildings have been erected from the designs and under the personal supervision of Mr. Edward Monson, jun., A.R.I.B.A., of Grosvenor House, the Vale, Acton. The contractor was Mr. John Cardus, of Birkbeck Road, Acton.

GENERAL.

Mr. Seymour Haden will read a paper before the Society of Arts on the 30th inst. upon the relative claims of etching and engraving to rank as fine arts.

The Duke of Northumberland has granted a site at Newburn for a Working Men's Club, which is to be built by a local gentleman at a cost of 1,000 guineas.

Mr. A. J. Style, Westminster, is preparing plans for a new infant school at Dartford.

An Open Competitive Examination for a County Surveyorship in Ireland will be held in Dublin in June.

Mr. Morris Moore has sold his painting, *Apollo and Marsyas*, which is said to be a work by Raphael, to the French Government for the Louvre.

Mr. R. Rowand Anderson, A.R.S.A., read a paper at the meeting of the Edinburgh Architectural Association, on Thursday, upon "Early Renaissance Architecture of Italy." The annual excursion of the Association has been fixed for Saturday, June 30, and will be to Haddington and neighbourhood.

A National Exhibition of Art, Science, and Industry is proposed to be held at Southport in the course of the ensuing year. The profits of the undertaking, it is suggested, should be devoted to the establishment of a permanent art gallery, museum, and technical college in the town.

The Committee of Council on Education have received notice of an international exhibition of graphic art engravings, etchings, lithographs, and drawings made with a view to their reproduction, to be held at Vienna from September 15 to November 1 next.

The Arrisfort, May 19th 1883.

PART OF WALL-PAINTING PANTHEON, PARIS.

By M. PUVIS de CHAVANNES.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MAY 19, 1883.

TENDERS, ETC

*. As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

*. Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."

COMPETITIONS OPEN.

The Architect.

FARMING THE HOMES OF THE POOR.

OMEWHAT in connection with our observations last week on the necessity for a general rectification of house drainage in towns, there is one peculiar question to which the attention of the public—not merely of philanthropists or scientific sanitarians—ought to be as soon as possible urgently directed. This is the practice which prevails of “house-farming,” as it is called ; a practice

which professes to be one of the most innocent expedients of convenience, but is in reality, in its effects upon the health of the labouring community, highly injurious.

Everybody knows that a family of poor people (to accept the title they themselves prefer to make use of) are obliged, in the large towns, to be content with part of a house, often only a very small part, for their dwelling. In London it is seldom more than two rooms, and, in the more central parts, most generally one. In the outskirts, where small houses are built for the purpose, the division is managed in a simple way : one *paterfamilias* more adventurous than others, or more steady, takes the house as a whole, paying rent, rates, and taxes, and perhaps repairs, occupying the two ground-floor rooms, or three, and sub-letting those on the upper floor, either together or singly. But in those interior quarters of the town where the houses of the poor are the cast-off dwellings of a better class, containing ten or twelve rooms, or more, the division is accomplished through the medium of a house-farmer or middleman, who usually has several of such properties under his control, and sometimes numbers them by the score. He is some such person, generally, as a small builder, or a shrewd shopkeeper, or a tax-collector, or a professional vestryman of the meaner sort, who “understands the neighbourhood.” In many cases he is an investor of capital so far in good faith ; and in other cases, of course, the property, or rather the business, has been inherited, so that, amongst the rest, there are a good many women engaged in this house-farming. The “business,” we need scarcely say, consists in collecting the weekly rents ; and a business it is that requires particular knowledge and particular skill. In a great many cases the profits afford a smaller living than would be supposed ; that is to say, when the middleman or “landlord” is reasonable in his estimates of rental value and “not too hard” upon his tenants. But in many other cases the profits are a good deal larger than would be supposed, when rents are run up to the utmost, and no mercy is shown to defaulters. As regards our more particular question of the cleanliness and good order of the houses, in the interest of the occupants and the public, it may be taken for granted that the larger the profits of the landlord, the less liberal is his outlay upon the luxuries of residence.

The district surveyors of the Metropolitan Board and the health officers of the local authorities well know what all this means in its practical working. Almost any quarter may be referred to as a flagrant instance, without much risk of mistake, which happens to be an appendage or dependent neighbourhood attached to some leading thoroughfare of London trade. Here the piece-workers labour and live. The tailors of the gay Regent Street quarter are a typical example, those shabby and half-dressed dressers of our fine gentlemen—and indeed fine ladies nowadays—who work very hard on Saturday, drink very hard on Sunday and Monday, and are hard to wake up on Tuesday. But there are many thousands of the same order of “poor people,” who, working hard all the week and not drinking at all, are still the neighbours of such as these ; and with all alike the same principle is paramount—that they *must* live where their work is. We need scarcely go on to show how it is that the whole class of people here involved become the prey of the house-farmer. There are no small tenements thereabout for small folk. Not only so, but, as the phrase goes, rents run high. A single room, with sufficient space and sufficient light to work by, readily lets at from five shillings a week to as much as eight or even ten according to its conditions ; so readily lets, indeed, that it is never empty, and would actually fetch more, but that the risk of getting

nothing at all waits too plainly upon the mistake of trying for too much. The writer has in his recollection at this moment a certain ground-floor “shop,” about eight or nine feet wide, with a prolongation backwards called a back-parlour instead of a den, situated in a back street, and rented at twenty shillings per week to people so poor and pinned together, and so wholly overwhelmed with the care of providing the twenty shillings every Monday morning, that the picture is indescribable, and one’s heart even ceases to ache at the sight because despair has turned the occupants into savages. In the house of which these “eligible business premises” form a part there are perhaps, at a guess, nearly twenty separate tenants, mostly holding single rooms, and all paying rents the highest in the neighbourhood. The “landlord,” a few years ago a small shopkeeper, is now a prosperous person, adding houses to houses out of his accumulating profits year by year, a man of local consequence, with sleek black cloth for his daily wear, and very probably a balance of nearly four figures at his banker’s. We say nothing against him, or against the class of shrewd men of business whom he represents ; but what is the result of their “mode of doing business” as regards the health and very life of their tenants ?

In order to answer this question it is first necessary to bear in mind how densely populated the regions are in which these middlemen flourish, and, consequently, how scarce an article the house accommodation is in which they deal. Observe also how anxious the poor tenants are to avoid that very serious disturbance of their affairs which a change of lodgings must always involve. The danger of offending the landlord is consequently one of the most important questions of their weekly existence ; and it is almost superfluous to add that the sanitary state of the house is a point upon which he is almost more touchy than on any other. So far the case is clear enough ; but we have next to remember what very hazy notions are entertained about drainage, and more especially what an utter confusion of ideas prevails as to “the smell of drains.” This “smell,” in short, is generally regarded by poor people not only as a necessary evil, but as a mystery, unfathomable except by bricklayers, and, when by some great genius of that craft occasionally gauged, never any the more on that account brought within the province of practical, permanent amelioration of mischief. Again, when the “smell” continues in spite of the bricklayer, or reappears as soon as his back is turned, how far it is really to be identified with a question of health is but a second mystery, deeper indeed than the first. That very unpleasant smells are “fit to poison” people, the poor know as an axiom ; but that this language signifies that they themselves are in actual danger of being killed by “the smell of drains” is not at all understood. The drains of the respectable house-farmer, therefore, are allowed by his tenants to stink in peace—we might almost say it would be an act of effeminacy to complain of them—and if the “backyard” generally happens to be in an equally free-and-easy condition, and the water-cistern no worse than the rest, why, so it must be—poor people have neither time nor temper to waste upon trifles, and, besides, what is everybody’s business is nobody’s.

Now and then the parish doctor raises a little commotion ; or the inspector of nuisances “has his attention directed to the state of the premises,” perhaps by an anonymous letter from some of the inmates—more likely from someone who has just left the house as a defaulter, for the actual inmates are afraid even to write an anonymous letter lest a bird of the air should carry the tale. But suppose the landlord takes the precaution of getting into the vestry, so as to be the doctor’s master as well as the inspector’s ? Of this we will say no more.

In winding up a description which we feel to be quite inadequate to the occasion, what we have to submit as a public question is this : Why should not these house-farmers, especially those of them who carry on the business on a grand scale, be by some means induced to regard it as part of their speculation to invest a little money in making the houses honestly wholesome ? Last week we tried to explain the fact that the rectification of the drains of an ordinary house is not at all a matter of serious cost or difficulty. In cases where the appliances are more than usually simple—as in the class of houses now before us they manifestly are—the cost and difficulty are still less serious. The more shame, it may be said, to those who take the profits of such houses and leave them in such a condition ; but we do not put it so. Could not the local authorities take a little

pains in the way of merely informing their house-farmers how easily they may sweeten what is so foul? A little pressure added to persuasion ought to do a great deal more. There is a Society of Health Surveyors somewhere, composed of the very officials in local charge of this matter. May we respectfully ask them to consider what can be done?

PICTURES AT THE ROYAL ACADEMY.

THE Academy exhibition this season is precisely of the quality which most perplexes that much-abused and much-tried profession, the art critic; not because it is actively, or even passively, a bad exhibition—in that case wholesome abuse were just and pleasant to administer; not because it is supremely good—such unusual call for enthusiasm would be welcomed; but precisely because this season's "picture show" is neither bad nor good: because, taken as a whole, it presents a rather high average of technical skill with a low level of artistic aim—the most dangerous condition of things for what is loosely termed "the cause of English art" that well can be. It must, however, be borne in mind that the Academy exhibition is no longer the sole representative of the work of the year, and that our painters now distribute the products of the studio over many of the numberless galleries that open throughout London. Still it may be taken for granted that the Royal Academy continues to receive the greater part of the best work that is done, and that certainly as to the condition of art training, and the tendency of art developments, phases, or cliques, it is fair enough to judge by what the walls of Burlington House present.

First, as to the matter of technic and the resources of painting, there can be no doubt that the gain is very great over the last ten years, and the current exhibition testifies strongly to the fact. The amount of careful drawing and satisfactory brush-work, of clever design and fair colour, is undeniable. Where you found such qualities in one or two places ten or fifteen years since, you find them now in twenty cases. The average is raised so generally that people fail to notice it, except when the happy thought strikes them to compare the work of artists now in their decline, who were the giants of past seasons, with the products of the young painters who are working their way to the front. The next point is to ascertain whether this raised level of technical power is balanced by equal elevation in the finer and deeper attributes of art—in aspiration of motive, in style, and so on. Indirectly we may get at some answer to this question. For example, for the aims identified with this paper we searched the Academy exhibition for designs of a nobly decorative character; then for such work as goes by the name of high art—such as historic subjects of a dignified kind, ideal scenes or types; or again, the treatment of ordinary incidents in so poetical or elevated a manner as to carry them into the higher ranges of art creation. What we have found is of decorative art very little at all: a few fair designs in black and white—not remarkable; a frieze by the President to illustrate the art of *The Dance*, which, with all consideration be it spoken, for the artist who has at the South Kensington Museum achieved a memorable wall-painting, is outside the pale of criticism; and a design by Mr. LINTON, one of his series illustrating the life of a soldier in the sixteenth century, *The Surrender*—and one not the best, though noble in colour and seriously thought out, inasmuch as the figures are too inanimate, and the composition lacks rhythmic coherence. This is not much to have found of decorative design. There is nothing this year by Mr. ALBERT MOORE. The few examples of treatment of the nude figure are merely imitative studies of the living model, and have nothing in common with those qualities of design by which the nude studies of INGRES were lifted into examples of monumental art. It is not sufficient to give a fancy title, as Mrs. MERITT, for instance, has done to her *Camilla*, to make of such a study something higher than a well-painted picture of a woman without her clothes. The hangers have indeed been shy of *Camilla*, and have placed her high at a corner, which is worse treatment than she merited.

On the lines of historic incident some of the best work of the year has been achieved; indeed, this kind of subject-matter gains in favour with our clever young artists. It gives them opportunity for the painting of costume and other matters delectable to a colourist, while they avoid the stigma of being mere costume painters by throwing power into the portrayal of

character and action. Mr. ORCHARDSON'S *Voltaire* venting his wrath after the famous whipping by DE ROHAN'S people, in vain gesticulation of appeal to lackadaisically sardonic Duc DE SULLI and a tableful of indifferent gentlemen, is one of the pictures of the year, and the cleverest and completest thing he has produced yet. ANDREW GOW'S *Trophies of Victory*, an incident of the war in the Netherlands, 1600, *A Whip for Van Tromp*, by SEYMOUR LUCAS, *At the Sign of the Blue Boar*, by ERNEST CROFTS, are all good examples of what may be called the anecdotic phase of historical painting, which, for the reasons we have hinted at, offer a tempting compromise to men who wish to put some intellect into their work. The admirable picture by Mr. WATERHOUSE, *Favourites of the Emperor Honorius*—the emperor is young, and his favourites are doves, on whose pretty caprices wait for audience a row of bowing monks with offerings of manuscripts and flowers—does for times more remote a like office of illustration, and his work has an originality of treatment in scheme and colour that shows his steady advance. Mr. TOPHAM has essayed, in a very ambitious canvas, the tragic note in a *Roman Triumph*—the whisper of the slave, reminding of mortality and death, to the emperor who is borne on high with his son in a golden chariot amid worshipping crowds. Considerable scale, a certain state and largeness of design, and the dignified import of the subject, demand for this picture a respectful consideration, which its technical merits hardly justify. The work does, indeed, just miss the mark, the painter falling, as it seems to us, into somewhat of a muddle of decorative and narrative manners, and not being quite sure of his own power. Nevertheless, this is the best composed and drawn picture Mr. TOPHAM has produced, and he sets a worthy example of the right kind of ambition. For the same reason one must needs applaud the effort of a more distinguished artist, Mr. DICKSEE, in his large group from the Parable of the Foolish Virgins, *Too Late*. Again the view is high, and the painter's technic is clever. The golden vesture of the maidens catches warm light from the unseen palace banquet chamber as they crouch on the ground in despair, or pass out into the dark night. Here once more we are met by that curious uncertainty of style which is the bar to complete success in so much English art, as distinct from French or Belgian or modern German schools. There is something of classic in the interlacing figures of the women, who pass onward into the darkness; we are a little reminded of the German painter, FEUERBACH, but the figure on the ground is altogether modern in feeling. Ideal form and poetic expression are beyond mere division into names and schools; at the same time, there is a certain consistency and cohesion of mode necessary to style. Unimportant in scale, but of high quality every way, is the small picture called *Psyche*, by Mr. POYNTER, a bust-length study of a Greek girl holding a spray of honeysuckle beneath a butterfly, which gives name and suggestive thought to the picture; behind her a vista of classic architecture. We find in this work precisely that virtue of style the absence of which was just now deplored; the lines are musical, the inner motive of the picture pervades the treatment, the type of the PSYCHE, delicately modelled in face and form, is one with her surroundings; no incongruities break the charm of the whole. A comparatively recent comer into Academy exhibitions, Mr. H. SCHMALZ, shows this year a procession to *The Temple of Eros*, which deserves warm recognition for deliberate grace and distinctive character, bestowed with artist-like workmanship upon a poetic theme. All modern classicism in art has a touch of the life and manners of to-day, except the realistic revivals of Mr. TADEMA, of which the interior with one figure, *An Oleander*, is a perfect example; but in spite of the modern touch, such pictures as those of Mr. POYNTER or Mr. SCHMALZ have more in them of the "upper air" of classic story than the most astounding piece of actuality that Mr. TADEMA ever painted.

The general term *genre* covers the branch of art in which the strongest work of the year, as seen within the Academy walls, is done. The *genre* of history, on which we have slightly entered, or of modern life in its various aspects, furnishes the limits within which most of the ready invention and mastery of means are expended. And it is not difficult to find typical examples or groups of painters who lead the way. In elegant and somewhat sentimental narrative work Mr. MARCUS STONE may still be accounted foremost, his careful and smooth technic aiding a certain refinement of manner. In the new phase of vivacious and realistic characterisation of everyday life, brilliantly vivid in impression, sparkling in execution and

the charm of motley colour, comes the group of which VAN HAANEN has been the apostle, to which now, in the wake of Mr. WOODS, is added Mr. LOGSDAIL. *The Piazza of St. Mark*, by this last artist, is a remarkable picture for thoroughly artistic representation of an actual scene—a Gavarni-like subject, invested with the poetry of light and colour and of swift, suggestive touch. The Venetian scene, *Preparations for the First Communion* among the fisher-folk of the lagoons, is Mr. WOODS' work, imbued this year with some added charm of grace and quietude. In rustic *genre* the man who shows most individuality is Mr. JOHN REID, whose picture of huntsmen scampering over a turnip-field was bought under the CHANTRY bequest a year or two since. *A Spill—not much harm done*, is another incident in another turnip-field, but the sameness is only accidental; an artist of such vigour is not likely to want topic. Luminous and strong in painting, hearty and wholesome in sentiment, not without touch of pathos, naturalistic but not vulgar—such is the art of Mr. REID and of those who think with him. The name of Mr. GREGORY, the new Associate, would naturally fall into notice of the school of *genre*, but he has not yet shown at Burlington House his characteristic work on such lines, although the little picture of *Piccadilly on Drawing-room Day* indicates something of his power of conveying the strongest impression of a scene as a whole by the combination of many accurately-perceived details of fact.

Landscape has received again full justice from the hangers of the exhibition, so far as what is present is concerned, but the aspect of the walls suggests that the "Scotch school" had command of the line. The influence of the "Impressionists" is certainly to be traced, and not disadvantageously in the direction of especial qualities of atmospheric effect, radiant illumination, poetic generalisation that suggests more than it indicates, and in harmonious *ensemble* of effect. We have marked one or two new names in this connection (to use a convenient Yankeeism), ALFRED EAST, H. C. FOX, STANHOPE FORBES, W. G. DAFFARN, DAVID MURRAY, and E. STOTT. The French school of landscape has not been without influence on some of the best painters we have of land and sea—Mr. ALFRED PARSONS, for example, all whose woodland work is very good and delightful this year; and Mr. HENRY MOORE, whose scene on the Hampshire coast, *Between the Showers*, has a rare glow of absolutely harmonious colour, with a closer and more tender impasto than is the wont of the painter. The direction of the most vital land and sea painting among us is not towards the splendid literalism of Mr. BRETT, nor the imitative and tender detail of Mr. ALFRED HUNT or Mr. OAKES, or the kind of painstaking interpretation of Mr. LEADER or Mr. VICAT COLE; it lies rather in a large and vivid impressiveness, by which the painter conveys not a record of minute facts, but the gathered effect of many sensations felt through the medium of the artistic perception, that "soul of a scene," as it has been called, which the most categorical setting forth of detailed truths may fail to reproduce. In fact, our younger landscape school and the rising painters of *genre* seem to proceed in opposite directions and on opposite principles—a divergence which has root in a philosophy of the interpretative mission of art, of which the practical exponents are perhaps the least conscious. No man is more the result and the reflector of the mental phases of his time than the artist.

Finally, in portraiture, the tide continues to set towards that broad and emphatic study of unidealised but intellectually apprehended character, with corresponding audacity of style and handling, which was first initiated by Mr. MILLAIS.

Such are some of the thoughts that this year's exhibition at the Academy has brought forward, which with similar reflections our readers may work out into so many of the twelve hundred and fifteen pictures which the council has admitted, as they may be disposed.

ROYAL ACADEMY.—SCULPTURE.

THE disposition of sculpture within Burlington House is now so satisfactory for effect that at first sight expectation is agreeably quickened, and hope rises to the audacious height of surmising a revival for sculpture in England. This year undoubtedly that type of plastic art which is associated with the monumental manufactures in New Road, or the pious memorials of the parish church, is happily absent; the array of busts is kept within limits, and a glance round the rank and

file of portraiture in the round reveals more character in the subjects, or, in compensation for lacking type, more art in the treatment. Moreover, those trivial objects in the way of statuettes and medallions, which used to look like wares set out in a china shop, are reduced in number, and take the form chiefly of sketch-models for statues or artistic relief. So far so good, therefore, and we accept a negative improvement; the next point is to ascertain what positive advance may be traced in the work present.

To begin with, we have, at any rate, one heroic and ideal statue, the result of genuine study and deliberation, the *Perseus* of Mr. GEORGE SIMONDS. This has been admirably placed out in the lecture-room, near the door of Gallery X., the arched marble casing of which gives a good frame line. Mr. SIMONDS, after true artist fashion, has given considerable thought and time—some five years—to this figure, which is both nobly and newly conceived. The attitude struck is that of PERSEUS at the marriage feast, when he confounds the plot of PHINEUS, who would rob him of his bride. He stands erect, and drawing the veil from the gorgon's head, turns the treacherous crew into stone. The firm torso and helmeted head proudly set rather upward on the strong throat; the long muscular arms and limbs, formed for endurance and swiftness, are modelled with a certain severity and large emphasis that belongs to the Græco-Roman rather than to the Phideian art. Fine expression of disdain for his foes, with some touch of dread remembrance, is thrown into the level brows and rich curves of the mouth, the slightly-averted turn of the head from the MEDUSA, and the set and spring of the figure. The head is small for the length of the body, but the winged helmet adds balance, and the mask and drapery held forward and aslant the torso, give make-weight to the backward set of the right leg. Altogether Mr. SIMONDS has produced a noble and thoughtful work, which should keep his name in enduring remembrance.

To turn from this ideal statue to the figures which, by importance of scale, next demand notice, requires a kind of mental somersault. Two niches of the central hall are occupied respectively by the colossal *Earl Beaconsfield*, in dark bronzed plaster, for the statue at St. George's Hall, Liverpool, by Mr. BIRCH, A.R.A., and the model for the *Sir Francis Drake*, by Mr. BOEHM, R.A., presented to Tavistock by the Duke of BEDFORD, and also, in replica, to be placed on the Hoe at Plymouth. Mr. BIRCH has been successful with the head of Earl BEACONSFIELD, but the figure in entirety does not strike us as satisfactory. The ornate mantle hangs limply about rather than drapes the form, and the left leg protruding from the folds seems hardly to belong to its body. There is, in short, a want of energy in the limbs, and a lack of cohesion and centre about the whole figure, although, to a certain extent, Mr. BIRCH has shown a power of dealing with the large scale. Mr. BOEHM's *Drake* is conceived picturesquely and forced up by much circumstance. The Elizabethan costume is made the most of; the great navigator touches with his right hand a terrestrial globe, which works into the general composition; the sturdy form has character, and fills out the doublet and trunk hose and stands firm on mother earth. And with this praise we have satisfied our conscience towards the sculptor's clever and defiant figure. Mr. BOEHM exhibits several busts of eminent persons, notably that of *Dr. Tait, late Archbishop of Canterbury*, which seems to us a coarse rendering of the Primate's countenance; also a strong version of the head of *Mr. Millais, R.A.*, in which the eager acuteness of the perceptive faculties is distinctly pronounced. This bust is Mr. BOEHM's diploma presentation work. Most interesting among the busts by other sculptors are the *Right Hon. W. E. Gladstone, M.P.*, and the *Sir William Erle*, by Mr. WOOLNER, both of which exhibit the artist's "fads," in the hideous denuding and blocking of the *Gladstone*, and the surface tooling in ribbon lines of the face of *Sir W. Erle*, to give tenderness and vitality; then we have the large bust of *Dr. Parker*, of City Temple fame, by Mr. BIRCH, A.R.A., a true oratorical type, with mobile mouth and swelling glottis; further, a refined and careful version of the beautiful calm face of *Dr. Benson, Archbishop of Canterbury*, by Mr. H. R. PINKER; a striking terra-cotta of *William Linnell, Esq.*, by Mr. ADAMS ACTON; a deliberate study of the acute face of *Mr. Eric Erichsen, F.R.S.*, by HAMO THORNYCROFT, A.R.A., noteworthy for the delicate treatment of the pupil of the large eyes, and the tender modelling about the brow. Mr. VERHEYDEN's bust of *Cardinal Newman*, well placed in the central hall, must be noted as an artistic per-

formance. A bust of *Sir H. Ibbetson*, by Mr. BELT, will be found under the number 1,617. About the most original work in bust-portraits is that in terra-cotta by Mr. SAMUEL FRY, who makes steady advance within his own peculiar lines. The charmingly upturned head of *Mrs. G. F. Bodley* is admirable for expression, and very delicately given by line rather than much wrought surface; also good is the portrait of *J. E. Hodgson, R.A.* Mr. FRY exhibits a large clay statue, entitled *Vengeance*, a woman draped in a gown falling away from her bared shoulders, who arrests herself in a creeping action, by throwing her weight forward on the right hand set flat on the ground from a straightened arm, while the left is turned behind her back concealing a dagger; her face and throat are thrust forward with an intense expression of hatred, horror, and watchfulness. The whole figure for dramatic power and concentration is remarkable; and though somewhat ragged and coarse in execution here and there, and unpleasantly square and huddled together when viewed from some points, yet the treatment as a whole is fine.

A statue of *Henry Irving as Hamlet* is sure of applause, especially as modelled life-size, seated in a chair in realistic fashion, with pictorially-treated costume, by Mr. ONSLOW FORD. The figure is, moreover, a good likeness of Mr. IRVING, both as regards face and limb, and the character of the Danish prince is no more absorbed in the individuality of the actor than was inevitable. A lady who makes a first appearance as a sculptress, ALICE M. SCOTT, must be congratulated upon her fancy figure of a cupid treading, in his path of roses, on *The First Thorn*. The nude form, long and graceful in proportions, is modelled with spirit, and the attitude of the boy, holding his bow straight out with the left arm to balance himself, as he looks frowningly askance over his right shoulder at the foot lifted in pain, is poetically conceived, without a touch of the common sentiment incident to the average treatment of such themes. The little statue is in dull silvered plaster, and the modelling is in character for metal work. Another first appearance is that of R. BARRETT BROWNING, in a clever little head in golden bronze of a coarse-featured young Italian model, *Adelia Abbruzzi*. The work, as art work, is better than any painting we have seen from this artist. The bronze head of an Arab, *A Study*, by ALFRED GILBERT, deserves mention also.

Several fancy statues, up to a certain mark of excellence for gracious design and average execution, have been assigned good positions. Of these Mr. LAWSON'S *Girl and Tortoise* is of the best, while Mr. MILO GRIFFITH'S *Summer Flowers* has more claim to freshness and energy. The Council have accepted several foreign works, and among them a group of the *Princes in the Tower*, a pleasing piece of naturalism by Signor FABRUCCI, and an equally unpleasing, even repellent, but clever bust of a "native" Christy Minstrel in all the audacious realism of coloured marbles and black face, the production of Signor CALVI. It needed the genius of a CORDIER to make this kind of thing go down.

Finally, we greet again with admiration the manly group, *Shielding the Helpless*, by the late Mr. E. B. STEPHENS, now shown in the marble, and assigned a niche in the central hall.

PARIS NOTES.

THE elections for the Salon Médailles d'Honneur in the sections of painting and engraving, held last Sunday at the Palais de l'Industrie, resulted in a complete fiasco, owing to the inability of the exhibitors to agree upon the most worthy recipients of these coveted honours. In the painting section the number of voters was 555. By the new regulations, a competitor to be successful must secure at least a third plus one of the votes cast; the requisite majority was therefore 186. No one succeeded in obtaining this number, and no Médaille d'Honneur can be awarded this year. M. Jules Lefebvre received 180 votes; M. Henner, 69; M. Hano-teau, 47; M. Bouguereau, 34; M. Feyen-Perrin, 28; M. Bastien Lepage, 18; M. Cazin, 14; M. Renouf, 10; M. Gervex, 9; and M. Carolus Duran, 8. In the engraving section the result was unfortunately the same, the regulation in this case requiring that an absolute majority of the votes should be secured by one of the candidates. Out of 70 voters M. Bracquemond obtained only 29; M. Gaillard, 13; M. Waltner, 8; M. Lalanne, 7, &c. Better luck attended the elections in the sculpture section held on Monday, when M. Dalon secured 54 of the 100 suffrages recorded. In

architecture no Médaille d'Honneur was voted, but the following rewards were adjudged: First class medal to M. Laloux. Second class medals to MM. Auburtin, Blavette, Aubry, Lefol, and Mayeux. Third class medals to MM. Aurenque, Mounier, Rey, Mosqueray, Moynan, and Marcel. Honourable mentions to Messrs. Abel, Chancel, Galeron, Hardion, Rogniat, d'Orbigny, Courtois-Suffit, Redon, Juvel, Cléret, Chabot, and Brice. In the painting section a first medal was awarded to M. Henri Martin, and second medals to Messrs. Giron, Gelibert, Marais, Sauzai, Demont-Breton, Beroud, Tattégren, Nozal, de Penne, Rochegrosse, Boudin, and Beraud.

In connection with the elections to the Salon prizes it may be interesting to recall the names of the artists who, during the last thirty years, have obtained the supreme reward of a Médaille d'Honneur in the section of painting. In 1855 at the Universal Exhibition, M. Meissonier; in 1865, M. Cabanel, after twenty-eight days' election struggle with Corot. In 1867 (the exhibition year) no Médaille d'Honneur was awarded, eight international medals being given in place of it, of which three were obtained by French artists—MM. Meissonier, Cabanel, and Gérôme. Then come, in 1868, M. Brion; in 1869, M. Bonnat; in 1870, M. Tony Robert-Fleury; in 1871 (year of the war), no exhibition; in 1872, M. Jules Breton; in 1873, no medal awarded; in 1874, M. Gérôme; in 1875 and 1876, no medals; in 1877, M. Jean-Paul Laurens; in 1878, at the Exposition Universelle, MM. Français, Bouguereau, Meissonier, and Gérôme; in 1879, M. Carolus Duran; in 1880, M. Morot; in 1881, M. Baudry; and in 1882, M. Puvis de Chavannes.

The object of the first in the series of Triennial Retrospective Exhibitions of Painting and Sculpture, which will be opened under Government auspices on September 15 next, is to get together the most remarkable works of both French and foreign artists executed since May 1, 1878. The management has decided that works exhibited in the 1878 Exposition Universelle cannot be received. As regards, however, those which appeared in the Salon of the same year, in consideration of the fact that they have since had no chance of being shown at any important exhibition, the committee will not in their case interpret the regulations too strictly, so that they are eligible for admission. Thus all works exhibited at the 1878, 1879, 1880, 1881, 1882, and 1883 Salons, as well as those that have never previously been brought before the public, may be sent in for examination by the jury. It must be noted that the period during which applications for admission might be made, by way of descriptive notices of the works proposed to be sent, expired on the 25th inst., and those artists who have not availed themselves of this convenient privilege must now deposit their works at the Palais de l'Industrie between July 10 and 20 inclusive, for actual inspection by the jury. Forms for the notice that must accompany each work may be obtained at the Secretariat-General of the Exhibition in the Palais de l'Industrie, on and after June 15, 1883.

Last Sunday two new rooms at the Carnavalet Museum were thrown open to the public. One of these, situate in the basement, has been turned into a very curious funereal crypt, and contains a collection of sarcophagi, models of tombs, &c., dating from the fourth, fifth, and six centuries of our era. The second room is devoted in great part to the iconography of the Palais Royal, including a model in relief of the galleries, executed in 1843 for Queen Marie-Amélie, and a fine collection of old prints illustrating the history of the Palais Royal from the seventeenth century down to the time of the famous wooden galleries and games of chance. This room further contains a series of medallions by David d'Angers, a collection of medals relating to the 1848 Republic, presented by M. de Liesville, and a few pictures of old Paris.

In view of the purchase of various pictures in this year's Salon on behalf of the State, arrangements are being made to provide room for them at the Luxembourg. This will entail a considerable amount of shifting, particularly in the section of painting, from which many works will have to be removed either to the Louvre or to Versailles. These removals are quite in accordance with the original design of the Luxembourg collection, which was intended to contain the works of living artists only, those of deceased painters and sculptors being handed over to other State museums as soon as possible after the death of their authors.

Alexandre Gergoune, a young sculptor of great promise, died last week after two years' suffering. The deceased artist had assisted with M. Ludovic Durand in the decoration of the Baden Theatre, with M. Falguière on the Paris Opera House, and with M. Jobbé-Duval in the restoration of Amiens Cathedral. Unfor-

unately he leaves no fortune and a widow with four children, who are utterly without resources.

The Baron de Trémont has lately founded, in connection with the Académie des Beaux-Arts, two purses of 1,000 frs. each, to be awarded every year to two young painters or sculptors who have particularly distinguished themselves in their course of study. The first of these prizes has just been awarded to M. Tureau, sculptor and second Grand Prix de Rome.

ST. GILES' CATHEDRAL, EDINBURGH.

ON Wednesday, St. Giles' Cathedral was opened by the Earl of Aberdeen, Lord High Commissioner, after restoration, which was carried out at the expense of the late Dr. William Chambers, the publisher. The following account of the work is taken from the *Scotsman* :—

It is now ten years since the work of restoring this venerable, but sadly desecrated, building was begun. These operations were, in the first instance, confined to the choir of the old cathedral, and extended only to the removal of the galleries, the providing of oak benches for the congregation, and of a better class of seats, in the form of cathedral stalls, for the judges and magistrates who attend the church in official state; the construction of a State pew for the Lord High Commissioner; of the introduction of a pulpit of carved stone, of tile pavings in the passages, and of an ornamental arcade of carved stone at the east end of the church. These improvements, together with a general cleaning of the walls and roof, were all that could be effected with the limited resources at the disposal of the committee who directed the work. The cost of these alterations amounted, however, to no less than 4,500*l*. Such a thorough restoration of the internal masonry of the choir as has since been effected through the munificence of Dr. William Chambers was beyond the means of the committee, although something of the kind was attempted. The old plaster was removed from the walls with the view of exposing the stone surface; but the masonry was found to be so defaced and so rough in many places, that it was deemed expedient to re-cover it with plaster. On removing the old plaster, an arched recess was discovered, with deeply cut mouldings of fifteenth-century work, the lower part level like a shelf. The back of the recess showed remains of coloured fresco. An opinion has been entertained that the recess had formed part of a monument to Napier, of Merchiston, the inventor of logarithms. This view seems, however, untenable. Napier died in 1617, whereas the recess has been in the wall since the fifteenth century. It was supposed that some discoveries of importance might be made by excavating the ground under the floor; and, accordingly, the whole area of the choir was trencched to the foundations; but nothing of interest was found except a finely built tomb-like structure, under what had been the site of the high altar of the original choir, which extended to three bays east of the central tower. This tomb had been partly demolished on two sides, and its contents, if any, removed, probably at the Reformation, when the whole of the altars were cleared out.

When Dr. William Chambers undertook, at his own cost, the complete restoration of the cathedral, further improvements in the choir were resolved upon, and these have been among the last operations carried out in the building. The elaborate stone arcade at the east wall, the exquisitely carved stone pulpit (though removed to a different position), the carved oak stalls for the judges and magistrates, and the common oak benches of the congregation, all remain unchanged. The wooden flooring under the seats has, however, been removed, and the whole area paved with small lozenge-shaped stone slabs and encaustic tiles, with marble steps at the different gradients in the level of the floors. Many regret that, instead of replacing the old seats, chairs should not have been introduced, seeing these would have given greater dignity to the architecture, as was observable during the temporary occupation of the nave, when that mode of seating was adopted. The restored choir is now considered the most successful part of the whole restoration. The stone vaulted roofs were, fortunately, only concealed with lath and plaster, which has now been removed. The beauty of the grand old masonry is equal to anything of the kind in Europe. The older portions of the vaulting in the choir aisles is of most remarkable and unique construction, illustrating a primitive form of groining of rare beauty and simplicity, of which few examples now remain. The stone vaulting of the Preston Aisle, with its finely-clustered ribs (from 2 to 3 inches wide), carved bosses, and narrow courses, is singularly beautiful. This was previously hidden by lath and plaster; it is now regarded as the gem of St. Giles'. The finely-clustered pillars which divide this aisle from the southern aisle of the choir were much shattered, looking almost as if they had been battered by artillery or mauled by sledge hammers. The clustered pillars on the south side of the nave aisles had been similarly maltreated; the carved capitals had their ornaments defaced, though a few had been partly mended with plaster, and portions of the shafts spliced with wood. These are now solidly restored in stone. The massive

octagonal piers of the choir were similarly shattered; and some of them had evidently been splintered by the action of fire—the effects, probably, of the burning of the church by Richard II. in 1385. The reparation of these pillars was a work of great nicety and much labour. This singular destruction of the principal supports of the superstructure may be referred to the political disturbances in 1572, when, after the death of the Regent Murray, Kirkcaldy of Grange went over to the side of the Queen's party, fortified Edinburgh, and, on March 26, placed a military force on the roof of St. Giles' Church, to keep the citizens in awe. On June 4 thereafter the craftsmen assembled in force and burst into the church to break down the pillars, with the object of bringing the whole fabric to the ground. Kirkcaldy defeated the mob by opening holes in the stone roof and firing at the assailants below. Calderwood, in his history, says he made the vaulted roof "like a riddle." The riddled vault, roughly mended with pieces of wood, bricks, and plaster, has now been restored in stone.

Entering from the Preston Aisle, is a fine restoration of the memorial chapel, built by Walter Chepman, who introduced the art of printing into Scotland in 1507. This chapel, in 1829, was converted into vestries of two storeys, with a furnace-room, coal-cellar, and other abominations, the arches being built up and defaced by the introduction of modern fireplaces and the finely-groined roof concealed by a ceiling of lath and plaster. In the roof, as now restored, may be seen the arms of Chepman, impaled with those of his first wife, Marion Kerkettill; and, on a corbel supporting one of the ribs, there is carved an eagle, the symbol of St. John, to whom the chapel was dedicated, with a scroll bearing the first two words of the Gospel of St. John in the Latin vulgate, *in principio*. The chapel was built in honour of James IV., the royal patron and friend of Chepman, of Queen Margaret, and of the Scottish heroes slain at Flodden. In the vault beneath were interred the remains of the great Marquis of Montrose on May 14, 1661. The chapel was afterwards known as the Montrose Aisle. On the wall is now a fine brass tablet, designed by Messrs. Hay & Henderson, and executed by Skidmore, of Coventry, erected to the memory of Walter Chepman by Dr. William Chambers. In this aisle has been temporarily placed the font, gifted to the church by a friend of Dr. Lees. It is of Caen stone representing an angel supporting a basin in the form of a shell, and was executed by Mr. John Rhind, sculptor, Edinburgh, after the famous original by Thorwaldsen. The font is intended to be ultimately removed to the south-west end of the nave, and enclosed with a brass railing.

The restoration of the nave was a work of considerable magnitude, involving much skill and no little ingenuity. This part of the cathedral had undergone much mutation during the alterations in 1829. When the whole character of the venerable edifice was modernised to the taste of the time, to make it fit, as has been remarked, for the inspection of George IV., the original pillars, octagonal in shape, and suited to the burden they had to bear, were removed, and replaced by slender fluted pillars, of small dimensions, overweighted in effect, and destitute of base, and with capitals moulded in plaster and ornamented with trumpery stucco foliage. The pillars were splintered in many places and seemed to be held together by thick coatings of paint. On removal of the plaster, the great arches were found to have been altered in form, the mouldings hewn off, and a state of matters produced that was altogether discouraging to the restorer. There was nothing to show the original form of the piers and arches until the floor had been excavated down to its former level, when portions of the original piers were found, along with pieces of bases, capitals, and arch stones. The process of restoration adopted was to encase the slender pillars with stone in the precise form and dimensions of the original. This was a work of much labour and cost. The vaulting of the aisles, when the lath and plaster had been removed, was found to be of stone, similar to that of the choir. That of the nave had been removed in 1829, when the walls were heightened, and a clerestory formed with a vaulting of lath and plaster. This vaulting has been allowed to remain, as, although of mere lath and plaster, it is a creditable example of that kind of work of the early part of the present century. The whole of the nave walls, internally, which had originally been of hewn stone, but nearly all changed at various times to common rubble, have now been restored with irregular square-jointed ashlar work. All the old ashlar has been used, without re-facing, where found in various part of the building.

The Albany Aisle and St. Eloi's (the Hammermen's) Chapel have been floored with marble and mosaics, embodying the appropriate arms and emblems belonging to each, worked out in a highly artistic style. These chapels are enclosed with wrought-iron grilles of beautiful design and workmanship, and embellished in gold and colour, executed by Skidmore, of Coventry, who has earned a high reputation during the last thirty years for this kind of work. The double aisle, on the south side of the nave, has its southern wing divided off by means of a wrought-iron screen of similar workmanship furnished by the same artist.

The chief entrance to the restored cathedral is by the west door. In order to improve the appearance of this elevation, and to remove somewhat of its baldness as left by Mr. Burn, Mr. Hay has designed a new and more handsome doorway. It consists of deeply-recessed jambs and arch richly moulded and carved. The

entrance is divided into two by a stone pillar, and in the tympanum above there is a quatrefoil panel with a sitting figure of St. Giles the Hermit, attended by the traditional hind. Above the outer arch is a double row of canopied niches, which are to be filled with figures of royal and ecclesiastical personages intimately connected with the history of the edifice. The north transept has an access from High Street. Formerly the entrance here was a single large doorway; but this has been divided in the middle by a moulded stone pier, and further narrowed by moulded jambs. The openings have arched heads, surmounted by a moulded and carved cornice, with tracery above, filled with glass. This gives light to the inner porch, occupying the sunken space at the bottom of the broad flight of steps which formerly led from the level of the street to the main floor. This porch is separated from the body of the church by a very handsome stone screen elaborately wrought, with a doorway in the centre. On either side of the doorway facing the church are six niches, with pedestals and canopied heads, each capable of receiving a sculptured figure of life-size. Canopied niches are provided above these for the insertion of smaller figures, the intermediate spaces being perforated for light. The canopies of the niches are in the form of pinnacles, richly crocketed, and with foliated finials, and their soffits delicately groined. The whole is surmounted by a moulded cornice richly carved in the hollows. The porch is roofed with a framework of panelled oak under the sill of the transept window; and a flight of five or six stone steps within the parapet gives access from the floor of the porch to the main floor of the transept. The latter is two steps above the floor of the nave. These steps are of solid polished Italian Burdella marble, and the floor of the choir, two steps above the transepts, has broad steps of the same material. The screen is of fine-grained hard stone from Troon, Ayrshire. A new porch has been erected on the east of the Preston Aisle, in order to form an entrance to the royal pew. In this is placed the old circular-headed doorway, which originally formed the entrance to one of the south-western chapels destroyed in 1830, and which afterwards held a position in the stone partition wall as an entrance to the Old Kirk. The doorway is of fourteenth-century art. The south transept is to be devoted to the reception of an organ, which is to be provided at an expense of between 3,000*l.* and 4,000*l.*; the machinery connected with it being housed in the addition erected at the angle formed by the choir and south transept. Further to the west, the angle formed by the transept and nave is to be utilised for a new vestry, occupying an area measuring 16 feet by 14 feet. The session-house, also new, will occupy the recess to the west of the main entrance in High Street, between the Albany Aisle and the St. Eloi Chapel, in which there were, prior to the alterations of 1830, two ancient chapels. The architectural style of these new structures correspond with that of the main building.

PROVINCIAL MUSEUMS.

A SMALL volume has been published on "Art in Provincial France," which consists of a series of letters written by Mr. J. Comyns Carr. In the introduction the author introduces the following sensible remarks on the organisation of provincial museums in Great Britain:—

The right of the large centres of industry to a share in the enjoyment of the national art treasures has hitherto been urged with but little effect. What has been accomplished in this direction is due rather to the earnest goodwill of those who have charge of the national collections than to the initiative of the Government. The authorities at South Kensington are permitted to circulate objects of art throughout the country, and within the last two years a small vote has been added to the estimates for the production of casts and copies of original works of value. But as yet no organised demand has been made by the representatives of the great towns for an annual grant to be devoted to the purchase of works of art for the local museums, and until such a demand has been preferred and admitted we cannot be said even to have accepted the principle which has so long prevailed in France. Nor is it likely that any real progress will be made in the matter until there exists in England some recognised authority to whom the representatives of the great towns can make their appeal. With no accredited representatives in the councils of the nation art lies at the mercy of the Treasury, and sometimes of the Treasury clerk. Even the national institutions of art whose claims upon the public purse are acknowledged have to struggle against a dogged resistance on the part of the Government whenever any effort is made to secure a special grant of money, or when the moment has arrived to establish a permanent title to a more liberal subsidy. The great spending departments of the country have their spokesmen in the Cabinet charged with the duty of defending their interests and of justifying every item of expenditure deemed necessary to efficiency; but the cause of art, both in and out of Parliament, has to depend upon amateur championship, which struggles ineffectually against the simple *non possumus* of those who hold the national purse-strings. And so it happens that unless the claims of the national institutions of art are made the subject of organised agitation even the most reasonable measures of development or reform are deliberately neglected

and delayed. There is no need to quote instances of the evil results which are attributable to this clumsy and incoherent system. The lamentable lack of enterprise and initiative in all matters connected with the public patronage of art is too well known and too widely acknowledged. But I may point to the recent loss of the manuscripts belonging to the Duke of Hamilton as affording conclusive evidence that under existing conditions we cannot hope to compete with the representatives of foreign Governments in their efforts to advance the cause of artistic culture. While we have been laboriously striving to set our cumbersome machinery in motion Germany has quietly appropriated the whole of this magnificent collection, and our own museums are left out in the cold.

And if our present system has dwarfed the development of the national collections, it has, at the same time, proved equally hostile to the establishment of any comprehensive scheme for the encouragement of art in the great provincial towns. Even if the claim put forward on their behalf were recognised by Parliament, it could only be effectively satisfied by means of an organisation which does not at present exist. Until such an organisation has been created, the legitimate aspirations of the great centres of industry will be apt to take a form that is calculated rather to excite opposition than to win encouragement and sympathy. For it must be confessed that the demands of those who espouse the cause of the provincial museums have sometimes assumed extravagant proportions. The idea that the contents of the British Museum or the National Gallery are to be scattered broadcast over the country is untenable. These central depositories of art must always remain as the prime objects of national liberality, and to rob them of any essential part of their resources would be a signal blunder which students in all parts of the country would soon find reason to deplore. In this particular, therefore, the process which had enriched the French museums is not applicable to our own case. The National Gallery is of only recent creation, the treasures it possesses do no more than suffice for the illustration of the different phases of ancient and modern art. It is not, like the Louvre, the heir of a vast inheritance of artistic treasure, and therefore it cannot like the Louvre endow other institutions, and yet retain uninjured its own supremacy. But in this inability of the central museum to satisfy the need of the provinces is to be found, I think, the strongest reason for asserting the principle which has so long been recognised in France. There the State gives both in money and in kind; and in money at least we need not show ourselves unable to compete with our neighbours. Nor does it follow because the British Museum and the National Gallery have now but little to offer that they will as a matter of course be always in the same plight. The resources of both institutions are constantly increasing by purchase and bequest, and it would be strange indeed if in progress of time the accumulation of treasure did not yield a proportion of work that might be appropriately distributed among the museums of the country. Even now the British Museum could render effective aid in this way. It is notorious that in the Print Room are stored a large number of duplicate impressions of valuable engravings, many of which would form a welcome feature in the art gallery of a city like Manchester. But there is another advantage which would surely follow from the acceptance of the principle upon which I have been insisting. If the claims of the provincial museums were admitted, the purchase of works of art out of the national funds could be effected upon terms that are now wholly impossible. The authorities in Bloomsbury and Trafalgar Square cannot afford to buy what they do not need for the purposes of their own institutions, and thus it often happens that a single work in a large and varied collection is acquired at a figure which is out of all proportion to the value of the whole. Under an organised system of art administration this would not occur, for the remainder of the collection could always be utilised to advantage even if it were not required for the central museum. The duty of effecting purchases of works of art would be entrusted to a properly constituted body representing the interests of art in the provinces as well as in London. The recommendations of such a body could not readily be ignored. They would carry weight with the public and with the Government, for they would command the support of expert opinion in every department. But the accomplishment of a reform like this cannot be brought about without a radical change in our present system. In order to awaken such a measure of public interest in the cause of art as would react upon the Government it is indispensable that our forces should be united and combined. It is indispensable, I mean, that the great institutions devoted to the service of art which are now under the control of separate and independent bodies of trustees should consent to be placed in some sort of harmonious relation to a central authority, and that such an authority should also have in its keeping the interests of the local art centres throughout the country. Until we resolutely set ourselves to the accomplishment of this preliminary labour it is vain to hope for any efficient aid from Government, however great may be the desire of the guardians of the national collections to do what lies in their power towards the encouragement of local museums. With the forces of art scattered and divided either political party can safely ignore their existence, but once establish an intelligent union between the metropolis and

the provinces in this matter and the interests of both will be permanently secured.

With regard to the form that should be given to the museums of the provinces, there is one conclusion which a survey of the existing institutions of France would seem to establish beyond dispute. No museum can be held to deserve the support of the Government, or to warrant the intervention of municipal authority, which does not accept the largest and most liberal interpretation of its functions. If the cause of art is to be served by such establishments, it must be by showing in what way the spirit of art can be made to enter into the life of the people, and by marking the enduring relation which exists between art and industry. In this way alone can the museum justify its existence. There is sometimes a danger, as I have taken occasion to point out in the course of these letters, of sinking the museum in the picture gallery and of thus dwarfing the conception of art to suit a merely popular taste. But this is not an expedient that could recommend itself to a public body anxious to promote the serious study of art. The picture gallery has its legitimate place in the scheme of the museum, but it represents only one of many varied forms in which the artistic spirit expresses itself, and the taste to which it appeals stands least in need of encouragement.

ST. OLAF'S CATHEDRAL, TRONDHJEM.

A CORRESPONDENT of the *Times* gives the following account of the restoration of the Norwegian cathedral:—

Trondhjem has many things to commend it besides the fact that it is the most northerly of the large towns of Europe. In one sense it owes its existence to the Gulf Stream, or to the combination of oceanic and atmospheric influences of which that "ocean river" is the popular symbol, for it enjoys a climate that is quite exceptional for so high a latitude; and it is a mere truism to say that, without its climate, Trondhjem could not be what and where it is. It stands on the southern shore of a magnificent fjord, surrounded by a splendid panorama of hills. Its fine harbour has been lately extended to accommodate the increased traffic which is expected to result from a new line of railway, lately opened by the king, and connecting it with the main lines of traffic through both Norway and Sweden. The town itself is cheerful-looking and interesting. Its streets are broad and clean; its public buildings are more than respectable; and it wears an air of importance, which it owes to its position as the natural outlet for the industrial products at once of the north of Norway and of the Norrland of Sweden. By far the most interesting object in the town, however, is the grand old cathedral of St. Olaf—Trondhjems Domkirke—which is now in process of restoration on an elaborate scale and at vast expense. This restoration is a work of national pride as regards Norway; but as regards Trondhjem it is also an act of gratitude, for it is a mere matter of fact that the town owes its origin and its initial prosperity to the existence of the cathedral. It was built over the shrine in which the remains of St. Olaf were deposited after his death in 1030, and at once it became the favourite resort of pilgrims from all parts of Scandinavia. The sacred shrine formed, as has happened in similar cases in the north as in the south of Europe, the nucleus of a flourishing town, the importance of which was intensified by the erection of many other churches and of not a few monasteries. In course of time the national cathedral became the burial-place of the kings of Norway, and the scene of the coronation of their successors. By the Norwegian Constitution of 1814 every king of Norway is required to repair to Trondhjem for the performance of the latter ceremony in the cathedral of St. Olaf. Bernadotte was crowned there in 1818, and Oscar II., the reigning Sovereign, complied with the constitutional ordinance by assuming his crown there so lately as 1873.

The original church was a simple basilica, about 150 feet long by 40 feet in width; but it was subsequently added to till it attained a length of 325 feet at the time of its completion and its greatest glory, about the middle of the thirteenth century. As its erection extended over a period of, at least, a century and a half, its architecture presents a curious mixture of styles, among which Gothic and Romanesque are the most conspicuous features. On five different occasions, between the fourteenth and the eighteenth centuries, it suffered from the ravages of fire, and, like many other ecclesiastical edifices of the Middle Ages, it fell a victim to the iconoclastic zeal of the Reformers. The wreck that was then saved was adapted to the purposes of Protestant worship, with the usual regard for material convenience, and with more than the usual disregard for architectural devotion. To these facts and feelings it is due that for several centuries a mere fragment of the grand old edifice has survived the destructive effects of Time's destroying hand. For generations the splendid nave has been a ruin, rendered all the more unsightly by the hideous buttresses and the patches of masonry thrown up in the well-meant but mistaken attempts of successive generations to preserve the edifice from absolute demolition. Till the work of restoration began twelve years ago, the chancel and the transepts were used as a parish church; but in the process of adaptation to

that purpose the interior had been mutilated in a most ruthless fashion, many fine pillars having been defaced, and arches and mural decorations having been obliterated with plaster work and covered with wooden fittings. The exterior of the western wall presents a melancholy aspect. Of a long row of statues of saints only a few fragments are left; and of the rose window and carved decorations there are barely traces sufficient to suggest what their pristine grandeur may have been. The work of restoration was begun in 1869, and already the choir, the chapter-house, and part of the chancel have been renewed in a style which does the utmost credit to the taste and the conscientiousness of the architect, Mr. Christie, and to the munificent liberality and public spirit of the people. The expense of the work is being defrayed partly by a Government grant and partly by local and private liberality. The Government grant amounts to 10,000 dollars a year, a further sum of 5,000 dollars a year is obtained from the profits of the savings banks in Trondhjem, and wealthy Norwegians, from the King downward, have shown their interest in the undertaking by handsome donations again and again renewed.

The work is being carried out on so elaborate a scale and in so earnest a spirit that other fifty years at least must elapse before it can be completed. At present only the transepts are used as a place of worship. Sometimes there is English service in the chapter-house, but that is quite exceptional. The nave has been temporarily roofed in, and is used as a workshop, which communicates with the chancel by a tramway tunnel under the transept tower. The restored choir is one of the most exquisitely beautiful pieces of church architecture to be seen out of Italy. It is octagonal in form and is lighted by delicately-carved Gothic windows in the upper storey. Its most remarkable feature is the beautifully-carved stone screen which surrounds the altar. Between the screen and the outer wall there is a passage which connects with small chapels projecting from alternate sides of the octagon and with the chapter-house on the north. The back of this screen is as finely carved as the front. There is no part of the whole choir on which the eye can rest which does not present some object of beauty—some thought embodied in stone. In the passage at the south-western corner of the choir is the famous well of St. Olaf, which, according to tradition, first burst forth when the saint's bones were deposited beside it. The stone of which the choir is built is *kloobersten*, or soap-stone, of a blueish colour, with irregular white streaks through it, making it resemble marble. It is easily worked and retains its sharpness and delicacy for a long time. The white marble pillars of the arches of the Gothic windows in the clerestory of the choir are richly and profusely ornamented. No effort of fancy, no expenditure of labour has been spared in the desire to make this part of the church unique as a thing of beauty. The work has been done, and is being carried on in the spirit of the old monkish builders, who were content to spend the labour of a lifetime on a pillar or a little chapel.

The altar stands on the spot where the remains of St. Olaf are said to have been originally buried—a spot that for centuries was a shrine to which pilgrims resorted in crowds year after year from all parts of Scandinavia. The altar is also of soap-stone, and the altar-piece which surmounts it is another fine example of conscientious work. It is a triptych in sculpture, having in the centre panel a white marble statue of Christ, and in each of the side panels the statues, also in white marble, of two of the Evangelists. The statues and most of the ornamental stonework of the interior are being executed by a native and self-taught artist from Gudbrandsdal, by name Bö. As he is still a young man of twenty-six or twenty-seven, there is reason to hope that he may yet have many years to devote to this noble work. Another beautiful feature of the restored work is the perforated stone screen between the choir and the chancel, consisting of three pointed Gothic arches, exquisitely carved, and suggestive of grace and aerial lightness. On the top of the centre arch there is a pedestal which is to bear a white marble statue of Christ. With the chancel itself not much progress has yet been made; but enough has been done to show the beauty and the grace of the delicate shafts which are to support the lofty roof, and the elaborateness of the wall decorations, all of which have been restored in the style of the original from fragments saved from the general wreck. One of the most striking features of the exterior is the porch of the Chapel of St. John the Baptist, on the eastern side of the south transept. A carved scroll in the rounded arch of this doorway sets forth the legend of the Temptation and the Fall in quaintly grotesque figures. The boss of the arched roof is a half-length figure of Christ in full relief, looking downward, and holding up the right hand in the act of blessing those who enter. Between the two inner doorways leading from the porch to the church there is an elegant pillar supporting another figure of Christ, and over the arches of these doors there is a white marble screen very richly carved in floral work. The Norwegians are very proud of their cathedral and of the work of restoration in which they are engaged, and with good reason, for it is, in truth, a very noble national effort to preserve a splendid national monument. It is likely to become the resort of pilgrims of another sort than those who went there to worship the bones of St. Olaf—namely, lovers of the beautiful in architecture and admirers of the true and the good in human effort.

NOTES AND COMMENTS.

WILLIAM CHAMBERS, who died on Sunday last in Edinburgh, expended so much money on works of building for the advantage of the public, that a tribute to his memory should be given in an architectural journal. His restoration of St. Giles' Cathedral, in Edinburgh, will cost about 50,000*l*. He presented to his native town of Peebles an institute building containing a public library of 15,000 volumes, a museum of natural history, an art gallery, reading room, and lecture hall. WILLIAM CHAMBERS was an active agent in the construction of new streets through some of the most squalid wynds of Edinburgh. It was estimated that during his term of office as Lord Provost 2,800 houses were taken down, and over half a million of money was expended on improvements, by which the death-rate of Edinburgh was diminished from 26 to 20 per 1,000 per annum. To WILLIAM CHAMBERS must also be given the credit of establishing cheap literature. When he commenced his career as a publisher little attention was given to art, but CHAMBERS did not overlook it. Among his early cheap reprints was "REYNOLDS'S Discourses," which was sold for a few pence, and his "Miscellany," "Papers," "Repository," and other publications contained more or less relating to art and artists. Long before South Kensington was founded he insisted on the advantage of drawing as part of the ordinary educational course. Few men have been more useful to their generation than WILLIAM CHAMBERS.

M. LIRA, whose *Remorse of Cain* was one of the principal pictures in last year's Salon, has again shown his mastery of the figure in a painting representing PROMETHEUS chained to the rock, which is now in the Salon. For inspiration the artist has had recourse to GOETHE, but the picture is even better adapted to serve as an illustration of SHELLEY. In the design by FLAXMAN the Titan is almost a reproduction of the Farnese *Hercules*, if we can suppose that figure to be chained and in a rage. This treatment may have been in keeping with the spirit of the Greek tragedy. But the modern notion of the champion is expressed by SHELLEY when he says that PROMETHEUS is "the type of the highest perfection of moral and intellectual nature, impelled by the purest and the truest motives to the best and noblest ends." The PROMETHEUS depicted by M. LIRA might have been suggested by SHELLEY's words. The head is expressive of "the saviour and the strength of suffering man." The chained Titan, indifferent to the approaching attack of the vulture, seems, with his far-gazing eyes, to await the final triumph of justice. The figure, which is stretched towards the spectator, is ably fore-shortened, and by making it of ordinary stature, and with the sensitive flesh of a nervous temperament, sympathy is excited at the first glance. Near PROMETHEUS is a torch suggestive of the fire which was brought by him from Heaven, and the smoke, like a serpent, passes over his body. Below is a lake, and more mountains are seen in the distance. The *Prometheus*, like the *Cain*, is a tragedy on canvas.

THE Society of Arts propose to hold a public meeting on Thursday, the 31st instant, at three o'clock, to consider and discuss a report which has been prepared by a committee of that body on the best means of preventing loss of life by fires in theatres and other places of public resort. The report deals principally with the following points: (a) Structural arrangements (including arrangements for heating, and with special reference to exits). (b) Arrangement and treatment of scenery and accessories. (c) Arrangement of illuminating appliances, and stage effects involving the use of gas, pyrotechnic compositions, &c. (d) Regulations, organisation of fire-brigades, &c.

THE fees paid to the district surveyors of the metropolis during last year amounted to 51,383*l*. 11*s*. 10*d*., representing 29,275 building operations. For new buildings the sum paid was 23,221*l*., for additions and alterations 13,695*l*., and the remainder was on account of "arrears." The gross fees received in thirty districts during 1881 varied from 5*l*. to 575*l*. In one of those districts the receipts did not amount to 100*l*.; in five districts the receipts were less than 300*l*. each; in nine, less than 400*l*. each; in ten, less than 500*l*. each; and in five, less than 600*l*. each. In thirty-seven districts the receipts ranged from 618*l*. to 2,638*l*.

THERE appears to have been somewhat more demand during last year for the vacant building sites belonging to the Metropolitan Board of Works. In Northumberland Avenue seventeen plots were disposed of at ground-rents amounting to 15,712*l*. a year. A plot of ground in Bethnal Green Road, and one in Great Eastern Street, both reserved for working-class dwellings, were sold by auction, the former for 2,020*l*., the latter for 2,500*l*. Part of another plot in Great Eastern Street was also sold for the same purposes for 1,272*l*. The whole of the building land in Great Eastern Street has now been let, twenty-four plots which remained unlet at the end of last year having been since disposed of. Thirteen more plots of surplus ground in Theobald's Road and Clerkenwell Road have been let at ground-rents amounting to 373*l*. a year. A small plot adjoining the Holborn Town Hall was sold in January for 400*l*. In Tooley Street eight plots have been let at a total ground-rent of 348*l*. A plot at the corner of Southwark Park Road, intended for a public-house, realised 5,000*l*. At Camberwell fifty-one plots have been let at ground-rents amounting to 2,135*l*., and two public-house plots were sold for 5,300*l*. and 4,890*l*. The rents received by the Board during last year amounted to 109,854*l*. 10*s*. 6*d*. Several persons who have entered into building agreements not having submitted plans, as required by the conditions of letting, nor proceeded with the erection of buildings within the specified time, the Board have had under consideration the advisability of resuming possession of the plots agreed to be leased to them. This course has been adopted in two cases.

ON Monday last the First Commissioner of Works again announced that he would shortly invite architects to compete for the new War Office and Admiralty. He anticipates that so much time will be needed in settling the competition, in preparing working drawings, and in arranging the tenders, that it is not likely to be necessary to ask the House in 1884 for a vote towards the expenses of construction. It is also anticipated that the work will take ten years to complete. That is a long period for a building to be in hand, which will probably be Renaissance in style, and is to cost about 600,000*l*. The right of Parliament to criticise the plans is admitted by Mr. SHAW-LEFEVRE, and therefore some nights in the Parliament of next year will be occupied with discussions about architecture. It is to be hoped they may be more profitable than the debates on the style of the Parliament Street offices.

THE creditors of the estate of the contractors for the New Law Courts will not be gratified by the statement of the First Commissioner of Works, which may have the effect of raising a prejudice against the contractors. Mr. SHAW-LEFEVRE informed the House of Commons that the statements of the contractors were exaggerated, that there was no definite claim, and that the late Mr. STREET, shortly before his death, had stated that the contractors were overpaid rather than underpaid. On the other hand, the accountants for the trustees of the estate say: "It is an incontrovertible fact that the amount paid to the contractors to the present time (including the 10,000*l*. retention moneys which the Government are seeking still to keep) is less than the actual cost to the contractors in hard cash for work and materials, without allowing them anything for interest on capital or profit." Mr. SHAW-LEFEVRE says that Mr. STREET's estimates for the first half of the building have been found to be most accurate. The accountants say that "the specification upon which the original estimate was made was altered by the architect in the actual building in almost every material particular, the additional cost under two heads alone amounting to about 40,000*l*. Notwithstanding this, he informed the Government that there could not be more than 10,000*l*. of extras over the whole contract, which amounted to about 700,000*l*." They also allege that the Government declined to make further advances to the contractors unless the right to arbitration was abandoned. It seems to us that the case against the contractors is not so clear as is supposed. Mr. STREET at first was compelled to alter and re-alter his plans to gratify Mr. AYRTON's notions of economy. Afterwards he fell into the habit of altering by setting one class of work against another, and he supposed that the omission of certain things became an equivalent for something new which he had introduced. But an architect's valuation of work differs from a builder's, and hence arises the present difficulty.

DESIGN FOR BASCULE BRIDGE OVER RIVER THAMES, BELOW
LONDON BRIDGE.

IT is recorded that when JAMES I. threatened to punish the citizens of London by the removal of himself and his court to some other city, the Lord Mayor calmly informed the King of the hope of the citizens that His Majesty would leave them the Thames. So long as the river remained the people of London believed that they might endure the loss of even the SOLOMON of the West. Since that time much has been done by means of railways and improved roads to facilitate the intercourse of nations and to promote commerce; but the Thames is still what it was in the days of King JAMES, the link by which London is united with the rest of the world. If, as Sir JOHN HERSCHEL says, "London is the centre of the terrene globe," that position is due to the possession of a navigable channel. What other city can show such a proof of international trade as may be witnessed every day in the year between London Bridge and Blackwall?

The supremacy of London in commerce is in a great measure attributed to the navigability of the river, and in dealing with the Thames this fact should never be overlooked. While everyone admits the advantage of unimpeded communication between the parts of the metropolis on both sides of the river, it should also be remembered that an advantage of the kind would be dearly purchased if to secure it impediments were raised to interrupt the traffic on the water. The local requirements of Whitechapel and Bermondsey should never be allowed to override the general interest of the city (which is also the interest of England), and although it would be well for carts from Shoreditch to reach the Old Kent Road expeditiously, the gain in time would hardly compensate for the loss that is inevitable if commercial arrangements which have taken centuries to mature should be disturbed or destroyed.

When, for example, it is proposed to erect a bridge with a massive pier in the very middle of the waterway, or a bridge of a height that will prevent many of the vessels that trade with London from passing under it, or a bridge on so ingenious a principle that there is risk of the intricate machinery becoming disarranged in the opening or closing, it is evident that in every one of those cases there is a certainty of interference with the traffic of the Thames, and the trade of the port will in consequence be sacrificed to local interests. On the other hand, a fixed bridge at a high elevation above the river would involve local inconvenience, for it must be costly, and unless the approaches are carried for a great distance inwards, the gradients will be steep and involve a loss of tractive power.

If the foregoing assumptions are correct, it is evident that the question of constructing a bridge over the Thames below London Bridge is one in which compromise is demanded if there is to be a satisfactory solution. Something must be abated by all parties, by the representatives of land traffic as well as by the river-side proprietors. It is physically impossible to have a bridge with easy gradients for land traffic, and which will be also clear above the highest masts, or one on a low level which shall still be equally convenient for ships and waggons; and the most prudent course will be to construct a bridge on a principle that will give a minimum of inconvenience while allowing of easy gradients and a capacious waterway. In the opinion of the special committee of the London Corporation who were appointed to investigate this question, the design which is illustrated by us this week complied with those conditions. The committee reported that the design commended itself to them "as one providing a bridge which would interfere but very slightly with the river traffic, and would bring about that relief to the commerce and trade of this city contemplated by the references to your committee."

It will be seen from the illustrations that the CITY ARCHITECT has adopted the bascule principle for his bridge, as being simple in arrangement, economical and convenient, besides admitting of that architectural effect in the towers which is necessary for a structure placed in so important a position.

The proposed bridge, having in its centre the same height of waterway as London Bridge, viz., 29 feet, would consist of two side spans of 190 feet each, and a centre span or opening of 300 feet. The roadway of side spans would be carried by two wrought-iron lattice girders, of ordinary type, or by shallow lattice girders carried by suspension chains from the towers,

with girders spaced 35 feet apart, and cross girders between carrying buckled plates on which the railway would be bedded.

The centre span of 300 feet would be bridged by two hinged platforms, forming the "bascule." The longitudinal and cross girders and buckled plates of the platforms are all proposed to be steel, to reduce the weight as much as possible. Each platform would be suspended by eight pitched chains, passing over polygonal barrels fixed in the semicircular arches between the towers and from thence to the hoisting machinery in the towers, where they would terminate in a plain chain or iron rod carrying the balance weights.

The hoisting machinery could be worked by steam power, or by hydraulic apparatus, supplied by tanks fixed in the roof of the towers.

The arches between the towers carrying the polygonal chain barrels would be formed of four wrought-iron braced semicircular arched ribs, connected transversely by four wrought-iron lattice frames. The rise of each arch in centre would be 130 feet above Thames high-water mark, or of 100 feet headway for a width of at least 150 feet.

The principal advantages of the design proposed are—

First. Lowness of level and, consequently, easy gradients for the land traffic.

Second. Economy of construction in the approaches on both banks of the river, the lowness of the level allowing of direct access, and necessitating very slight alterations of the adjoining streets and properties.

Third. Occupation of less river space than a swing bridge, which, when swung open, requires a clear space equal to the half span of the bridge.

Fourth. Less interference with the tide-way, or navigation of the river, there being only two towers or piers, instead of three or four, as in the swing-bridge schemes.

Fifth. Beauty of form. The chief features of the bridge being capable of architectural treatment, it might be rendered the most picturesque bridge on the river.

Sixth. Facility and rapidity of working by the special arrangements of machinery proposed. For instance, a ship signalled at a quarter of a mile distant, and sailing or steaming at the rate of, say, six or seven miles an hour, could pass through the bridge and the land traffic be resumed in three minutes; or if half a dozen vessels were within half a mile of the bridge all could pass in five and a half minutes.

It has been estimated that the cost of the bascule bridge, including approaches, machinery, maintenance, &c., would not exceed 750,000*l.*, which is about one-half the sum that would be necessary for the construction of a high-level bridge allowing of equal facilities for the river traffic.

WALL PAINTING IN THE PANTHEON, PARIS.—IV.

THIS illustration shows the left wing of the large wall painting by M. PUVIS DE CHAVANNES. The corresponding division was published last week.

THE ARCHITECTURAL ASSOCIATION.

THE twelfth ordinary meeting of the Association was held on Friday evening, the 18th inst., Mr. E. G. Hayes, president, in the chair. The following gentlemen were elected members: Messrs. G. W. Thomson, E. M. Rashdall, S. H. Hunter, and Field.

Mr. F. E. EALES, hon. secretary, read the list of officers nominated for the ensuing session, Mr. Cole A. Adams being nominated as president, and Mr. Stannus and Mr. F. E. Eales as vice-presidents.

Mr. J. W. N. MILLARD then read a paper as follows, entitled:—

Architectural Sketching and Sketching Trips.

In choosing this subject, I have assumed that there are very many members of the Association who do care about being able to sketch, in spite of the fact that one still occasionally comes across individuals, who, with a smile, inform you that they "never sketch," as though it were some species of light amusement quite beneath their serious notice, and declare that they would as soon buy photographs! I might perhaps rest assured on the point when I remember that for fourteen years the "Association Sketch Book" has been maintained by members, and still continues in at least as flourishing a condition, I think, as ever it was. Yet, if I were to rely for my audience on all the contributors to the "Sketch Book," for, say, the past two years and a quarter, *i.e.*, since the "New Series" began, I could only count upon 40 out of a body of young architects numbering nearly nine hundred. Of course, I may be

told that the whole body of "sketching" members in the Association is not fairly represented by the contributors to the "Sketch Book." Then, I will only ask whether they ought not to be so.

Now, since I venture to hold the opinion—surely not an altogether strange one,—that architecture can only properly be studied from buildings, not from books or drawings alone, and that therefore no amount of mere office work can suffice, in place of travel, to produce a well-educated architect, it appears to me that the question of sketching becomes a matter of the greatest possible importance to every earnest student of architecture, and anything but a light amusement, particularly as, I think it may be found that it implies something rather more than the mere making of sketches. At the very least, it must be an immense help to a man, in many ways, to have acquired the habit of producing intelligible representations of architectural forms, whether from the works of others or ideas of his own, since he is thus enabled to put his impressions on paper for himself. Nor do I see exactly how one can hope ever to acquire any thorough knowledge of architecture without some such power. Moreover, I cannot imagine that he could feel much real interest in architecture who did not want to be pursuing the study of it whenever he got the opportunity; and I should like to know how he can do so better than by sketching.

By architecture I of course mean, at least for to-night, only the art of that name, not the whole hybrid business, usually so termed, comprising, so far as I am given to understand, nothing less than the entire profession of building-surveying, with a knowledge of the quality and market value of all kinds of material and labour sufficient for an enterprising contractor; a grasp of physical science, constructive formulæ and methods of calculation so essential to an engineer; acquaintance with "authorities" and skill in expounding the mysteries of easements and arbitrations, compensations and contracts, and cases of "ancient lights," such that a lawyer might envy; as well as a general capacity for conducting affairs of all sorts, and especially anything to do with the management of property, insurance agency, or advertising; in fact, so many and such varied "accomplishments" that the wonder is what room there can be left for architecture proper. Yet it is with this apparently insignificant, though really all-important, branch of the "business" only, that sketching has anything to do.

But again, beyond being of service to a man as a student and draughtsman of architecture, the habit of sketching must tend to bring out whatever artistic ability he may happen to be endowed with, to accustom his eye to appreciate delicacies of form, subtlety of proportion and beauty of composition, and all those niceties that go to make just the difference between the work of an artist and a "cobbler"; thereby to set him thinking and rouse his imagination; and, in a word, to at once furnish him with ideas and give him skill and readiness in expressing them.

So, finally, it may prove of chief use to him as an architect, if, by that title, we understand an artist who moulds and fashions the forms and features of buildings, just as a sculptor moulds and fashions the forms and features of his figures, or a painter composes his masses of light, and shade, and colour. Then if such he be, shall he be any less observant than either painter or sculptor, less ready to take note of everything that may have any bearing on his work, less in earnest about what he produces, or, in short, less devoted to his art? And what artist is "worth his salt" who is not devoted to his art?

It is not so much to those who are already accustomed to sketch that I will presume to talk to-night, as to the younger members who have only just commenced to do so, or who are still but half inclined to begin, and to them I would say, a student who would become a sketcher cannot start too early. It should be the first thing he takes up, not the last, as too frequently is the case, since it may exercise an influence on all the work he ever does and may leaven, as it were, his whole future career. Who knows how much artistic power is lost to us, merely for want of its early cultivation? So many put off beginning to sketch until, as they say, they can go "a regular tour," as if such an occasion as that, were not exactly the time when the power of being already able to sketch is most indispensable. Of course, everybody must learn to sketch by sketching, but it is almost pitiable sometimes to see men starting off on a tour of several months or more, it may be, who have yet to acquire facility, perhaps even to make their first attempt in outdoor sketching; going, in fact, to learn how to sketch, with the certainty of losing much precious time in doing so, and with it half the benefit of their tour, simply because they have neglected to begin earlier, by spending Saturday afternoons and holidays occasionally, in trying their hands at whatever subjects happen to be nearest. Consequently they so often return just as they are beginning to use their pencil with any real pleasure, dissatisfied with the small amount and poor quality of the work they have to show for the time they have been away. With sketching, as with the language of a country you may be about to travel in, whatever little time is devoted to it before starting, is sure to be doubly repaid you on the tour. It stands to reason, then, that the sooner a student takes up sketching at any odd times, the better use will he be likely to make of subsequent sketching trips, to say nothing of the good work he may generally accomplish without going very far, if he be determined to make the best of what there is around him. At first,

probably, he feels a trifle timid, especially if he knows nobody more advanced than himself to take him out sketching. In that case, let us suppose he starts off alone, on the sly, for some small village church that he has already been to have a quiet look at several times. Concealed under his coat is a brand-new sketch-book, which he presently produces—if nobody is about—and now he finds himself really going to make his first outdoor sketch. Before, however, he has fairly set to work at the little round-headed window or plain-pointed doorway that he has modestly selected as a subject, he is startled by the sound of a horse and cart in the distance coming down the lane, and hastily thrusting the book into his pocket, he tries to appear just as though he was "not doing anything." The danger past, he at length puts pencil to paper—and rubs it out again. Nor is it likely that any previous training he may have had in drawing indoors, shading from the cast, or even knowledge of perspective, will prevent the awful suspicion from crossing his mind that, after all, he is only just beginning to learn to draw. Again, he is alarmed by voices of children on their way to school, or by a cow looking over the hedge, and it may take some little time before he gains sufficient confidence in his powers not to mind having people overlooking his shoulder, as they always will, even those who might be expected to know better. I think, however, he will invariably find that no artist will do so without first asking permission. By-and-by, of course, when he has become a confirmed sketcher, he will never hesitate, so long as his subject requires it, to incur the consequences of calmly planting himself on his little three-legged stool in the middle of a busy market-place or narrow thoroughfare, with the inevitable result of being immediately hemmed in by a curious mob, all trying to get front places at once, and all utterly regardless of the fact that the poor artist himself might prefer to have a peep at what he is endeavouring to represent.

Possibly, in choosing his first subjects, the beginner will be satisfied with nothing less than views of complete buildings, all the ivy perhaps, and the grass in the foreground included, usually involving a needless expenditure of black lead. In fact, the choice of subjects and points of view is one of the first and greatest difficulties to a beginner. However, whether his primary object be to learn to sketch or to become acquainted with a style, he will be wise to confine himself to single features and their details, drawn sufficiently large to explain their design, and with as few lines as possible.

It may seem a matter of trifling importance to suggest here, that reasonable care should be taken of every sketch made, from the very first, but I cannot help fancying that anyone who has sufficient regard for his sketches to keep them clean and in order, named and dated, and is not given to tearing them up or to working from both ends of his sketch-book at once, will be all the more likely to produce work worth keeping. Even a poor sketch will contain something that renders it not altogether worthless to its author, though the actual making of it must be the point of chief value to him. Then he will be anxious to acquire what is understood as a "touch," *i.e.*, a distinct method of "short-handling"—for so it may be called—with the pencil. He will have noticed perhaps, how, in good sketching, the lead is economised and made the most of, as though it were a precious material—which, as regards the sketch it really is—every stroke being made to express as much as possible, and the white paper cunningly left between, apparently doing half the work of rendering the effect.

At first, nearly all beginners' sketches have a more or less curious "woolly" look, arising partly from the attempt to represent too much and a tendency to exaggerate unimportant points, but mainly from indecision and a very natural want of confidence, the lines not being laid each at a single stroke and then left. Practice on smooth paper with a good pencil will often help considerably to shake off this. By-and-by, most men, if they possess any aptitude for drawing at all, discover they have a "touch" of some sort, and what is more, just as much their own as their handwriting, of which, in fact, it is but a species. They may try to imitate somebody else's, and by so doing may improve their own, gaining greater delicacy or sharpness, and so on; but, I think, if they feel a proper pride in their work, they will be thankful rather than otherwise that their method of drawing, whether they will or not, is, to a certain extent, characteristic of themselves, and they will rely more on continued practice than on direct imitation of another's style, in order to develop their own successfully.

By way of illustrating these remarks, I have borrowed the sketches you see on the wall from some of my friends, Messrs. Baggalay, Stokes, Deane, Löhr, Hooper, Knight, Collier, W. and A. Pite, Conder, Wallace, and Sankey, to all of whom my best thanks are due, as well as to Mr. Arthur Street for the loan of three of his father's masterly sketches. I think you will find it interesting to notice how marked an individuality is shown in the style of each. In one point only might they mislead you, *viz.*, into concluding that a good "touch" necessarily implies good drawing. This unfortunately, is not always the case, though the converse will generally hold good. Far be it from me to undervalue quick rough sketches, because they are rough. A hurried sketch is always better than none at all, and it may be quite as valuable as a more laboured one, since only just what is wanted is given, and all the unimportant accessories omitted. As a drawing, too, in spite, perhaps, of a few

slips, it is often more powerful and telling than a highly-finished performance, from the very fact of the artist having thrown aside for the moment his habitual carefulness, and revealed himself unconsciously. But for sheer carelessness in sketching, as in aught else, there can be no excuse. An architect may, of course, deliberately draw a building or a feature otherwise than it really exists, for the very excellent purpose of trying the effect of such alteration, and seeing how he might adapt or improve upon the original; but a beginner has first of all to learn to draw what he sees, and therefore, generally speaking, a sketch cannot be too accurate, so far as it goes. It need not by any means give all there is to be represented, as a photograph does, and very often it will be all the better if it does not, but simply conveys whatever particulars of form and construction the sketcher wishes to note, and for the sake of which he makes the sketch.

I know it is not good that a beginner should be started with the idea that he need never make finished sketches, since he may be thus led into a slipshod, tricky style of work, and to imagine he can draw before that is really the case; but what I mean is that I would be readier to forgive him for producing a sketch of a door or a window, say, with the form of the arch correctly rendered, but without the joints, than if he drew the arch distorted, and then jointed it up elaborately. The real danger to be avoided is that of losing the whole feeling of a design, by errors affecting the general proportions of it; and I know nothing so discouraging, in making a sketch, as finding one has unintentionally got it incorrect in this respect, especially as one knows that no amount of detail, however neatly "touched in," can atone for it. Rapidity in setting out the leading lines and points of a sketch before filling in the detail is one important secret of correctly catching the proportions that the various masses bear to one another in perspective.

It may be said that the surest way of getting a thing correctly, is to measure it and draw it out to scale. No doubt it is the way to find out all about it, if that be worth ascertaining, and for showing it as it really is; but, invaluable as geometrical drawings are for such a purpose, they never show you what a thing really *looks like*, and this, rather, is what is wanted; in fact, in nine cases out of ten, almost all that is wanted. A student who goes out sketching architecture in order to learn to produce architecture of his own, cannot be expected to settle down at every subject he comes across, and make a laborious archaeological study of it. Now and then he may do so profitably, as in the case of work of unusual excellence, and for the special purposes of publication, or securing an authentic record; but to make a practice of this, would seem to be throwing away valuable time, since, whilst he is measuring and drawing out one thing with painstaking accuracy, he might be seeing a dozen others, and storing his mind with scores of ideas and suggestions for new work, the production of which is, after all, the real business of his life.

On the other hand, a perspective sketch is seldom quite complete enough for an architect without a plan and a few leading dimensions, if only to indicate the scale of the work, such as the width and height to the springing in a doorway or window, for instance. Mouldings and other details, too, are nearly always worth taking at the same time, sketched as clearly as possible. I may just mention here, that I myself have found colour-pencils most useful in taking details. Supposing the plan of a jamb be drawn in red, the arch-mould can be distinctly shown in its right position over it in blue, the outline of cap in yellow, and so on, instead of their being dispersed all over the sheet or several sheets. These pencils are also often very useful for indicating the colours of materials, even if they do not match them. The "knack" of scraping mouldings with the machine called a cymagraph may be admirably suited to the work of an archaeologist, who, of course, is nothing if not accurate; but an architect who wants to be able to draw mouldings for himself, will surely do as well to trust to his own hand and eye, guided by a few leading dimensions, when drawing profiles of existing work. How can he expect otherwise to produce good mouldings of his own? It may be natural enough for those who find a difficulty in drawing in perspective, to advocate a student's measuring, on the plea that it teaches him accuracy and care; but it has always struck me that if he be careless by nature, he will learn to measure and draw no more carefully than to sketch. To do either well, requires the habit of accurate observation; but though a man of ordinary intelligence can take a dimension correctly, and any average mechanical draughtsman can rule a fine line or strike it with a compass, it needs more than this to draw a thing as it appears. It needs a firm hand rightly guided by something better than a T-square—by a correct eye—and answering to every turn and shade of feeling in the artist's mind. Even in such matters as construction, jointing, &c., which perhaps furnish the strongest reasons for architects making measured drawings, old examples are so frequently more curiously or historically interesting than actually useful to us, that we may generally obtain all that is worth our having in a sketch. We may unreservedly admire the skilful use made of the means and knowledge that were then possessed, but nobody supposes we can afford nowadays, with other materials and methods, to go on everlastingly constructing our work exactly as they did centuries ago. The "old men" would be the first to laugh at us if we did! They tried to do the very best they could in every way under the circumstances, and

the present age naturally expects us to do no less in our altered circumstances. By this time, then, I should hope we have come to clearly recognise that what a modern architect has to do, is to produce *modern architecture*, not reproduce ancient!

Now that the "Gothic Revival," as a mere "Revival," is over, and has had its "History" written, there is perhaps but little need to be reminded of this. At the same time we see that one of the most remarkable points about the "Revival," if not its strongest point, was the almost strange enthusiasm with which its followers were inspired. The remains left to us of the style might partly account for this, but a further stimulus was given by the effect it had itself, in making many and many a man really care for architecture, as an art, who would otherwise have dragged out his existence as a mere mechanical draughtsman or soulless surveyor of building operations. Of course it did not make artists of them all, that was impossible; but it set them sketching, and awakened whatever in them lay of undeveloped artistic power. And though they confined their studies mainly to one period, and expended on a single style the enthusiasm they owed to their whole art, yet this was better, a thousand times, than the almost utter indifference to all art, against which their movement was so emphatic a protest. It was the breaking up, as it were, of the ice, and an assertion again, in these days, of the fact that there is such a thing as an art of architecture, to be practised.

And now that we are enabled to perceive there is more art "in heaven and earth" than in the thirteenth or any other century only, how much wider is our field for study! The whole range of architecture is open to us. The refinement of the Greek and the splendour of the Byzantine, the strength of the Gothic, the playfulness of the Saracenic, and the finish of the Renaissance, have each their lesson for us. What excuse have we if we fail to take full advantage of it?

So far as my experience goes, a young student starting on a sketching trip, often looks forward to enjoying it more thoroughly than he probably will in reality. What I mean is, that besides the possible difficulties and disappointments in learning to sketch well and easily, he will be almost certain, if he cares about architecture at all, to start with a preference for the work of some particular period, and will be constantly offended by coming across a mass of work that he dislikes. But I fancy the older he grows, and the more he sees, the broader he will find his views become, and he will then be amused to catch himself looking back on the days when he either totally ignored or violently denounced any work earlier or later than a certain century, and even allowed himself to be quite "put out" about it. He will learn to see through mere detail, and discern the work of an artist of no matter what date; and as he becomes more and more able to do this, so will he find his pleasure in the study of his art ever increasing, since he will be continually at every turn meeting with so much more wherewith to enrich his mind. Many a bright conception will he then begin to perceive in what he had called "debased" work; and by cultivating the power of seizing on the best points of a thing and making the most of them, instead of frittering away his time and trying his temper in the unsatisfactory task of mere fault-finding, he will probably come to the conclusion that, though the latter is the easier, the former is by far the more profitable employment. One advantage, at least, of travelling alone is, that no precious time need be lost in useless discussion about what is and what is not worth seeing and sketching. As a matter of fact, I suppose no two minds ever were quite agreed about the exact merits and demerits of any work of art—it would be absurd to expect that—but the value of it to each, as an artist, must chiefly depend upon what good he can get from it. And if the student looks at the work he meets with in this light, and is able to form a habit of making up his own mind about it independently, I think he will be likely to gain more from what he studies, than if he sits down to it, only from a vague notion that it is the "correct" sort of thing to go in for, or because others do so. My own feeling is, that he should be always on the watch for anything that suggests an idea to be worked out, or furnishes a *motif* that might be developed or applied in practice; in other words, that he should be constantly designing when out sketching, and imagining what might be made of his subjects. Studying fine architecture should, of course, be his mainstay, both for refining his taste and inspiring him with the desire that he too may, in time, do something good, that will live; but it is not from the works of great masters alone that instruction is to be gained. Besides all that they teach, there are to be found, in the designs of thousands of humbler artists, any number of brilliant, and perhaps not a bit less original ideas, though but half worked out, it may be, or unskilfully treated, which, nevertheless, another mind may lay hold of and bring to perfection. By thus developing and adapting from previous attempts, architects seem to have progressed in all ages, and consequently may be reasonably expected to do so in future.

There is no need for the student to rely entirely for his subjects on buildings of great size or importance. If he keeps his eyes open, he will be always noting, in quite ordinary examples, all manner of simple, inexpensive, and unpretentious ways of getting good composition and pleasing effects in everyday sort of work, just such as is likely to be of more immediate service to him than cathedral façades or apsidal chapels

Unfinished buildings, again, often afford a splendid chance for exercising his faculty of imagination, a source of strength, indispensable to every artist, though often neglected. Let the student, then, not forget to employ not only his hand but his *head*, remembering that sketching is, after all, but a means to an end, and that an accumulation of sketches and examples is only useful so long as the power is not wanting to turn them to account; whilst, at the same time, the cleverest by nature will produce little of real value unless he be careful to put something into his head.

As to methods of sketching, I have assumed that the beginner will, for some time at least, stick to good lead pencil and smooth paper, until he feels more or less master of his materials. To one who has made himself master of his pencil, the use of the pen and brush ought soon to come easily, and powerful aids he will find them, each in its way, whether he employ them separately or combine their work in the same drawing. With a wash, a mass or surface may often be rendered in a few minutes more truly than by hours of labour with the point, whilst with a pen the forms may be sharply accentuated, and the detail indicated to its proper scale by a few quick touches just at the points that require to be emphasised. After a time, then, the sketcher will probably do well not to neglect any of these implements; in fact, if he has any artistic feeling in him, he is not likely to rest content without testing their powers. He will be wanting to give more complete rendering of his subjects than is attainable with pencil alone.

This brings me to the question of water-colour sketching for an architect, which, I think, ought not to be looked upon only as regards its being of use to him in preparing perspective drawings. The question should be, Will it make him a better architect? If he cultivate an eye for beautiful form and lovely colour in nature, will he make better designs? If he care to catch the sweep of a cloud or the outline of a mountain, will he produce better mouldings or more picturesque sky-lines? If the colour of the sea or the tints on an old wall in sunlight have any charm for him, will he decorate a room more harmoniously or design a better pavement? The man who thinks he will is pretty sure to try water-colours as soon as he feels strong enough; the man who thinks otherwise—had better not make the attempt.

I can imagine many asking, how and when they are to go sketching. One hears of pupils being exhorted to do so in their fortnight's summer holiday. Some there are who respond to the appeal, but is it to be wondered at if the majority do not jump at the opportunity very enthusiastically, and only discover afterwards when they have become paid assistants, and are more tied than ever, how invaluable it would be to them? If average parents and guardians could but be brought to look upon sketching trips otherwise than as pleasant "outings," and could only be induced to entertain the notion of their proving a profitable investment of time and money, instead of meeting the suggestion with a smile of incredulity, they would surely stipulate for a more equal division of the pupil's time between office work and the out-door study of his art. As a mere mercenary speculation they might find that the latter would return interest at as good a rate, at least, as the capital, in many instances, sunk in the pockets of the practitioner who undertakes "to teach and instruct, to the utmost of his skill and knowledge, the aforesaid pupil in the art and profession of an architect, in consideration of the above-named sum," and undertakes in addition, "to allow him one fortnight's holiday in each year, at such time or times as he may think proper."

I know of no more striking instance of a "good investment" in the way of sketching trips than that related in the *Life* of the late Sir Charles Barry, by his son, Dr. Barry—a book to be read by every young architect—at the very commencement of his career. It tells us how, when coming of age, he inherited a modest sum of money and deliberately determined to devote it to an architectural tour. With your permission I will quote the following passage. "He saw that his only chance of developing the power and satisfying the desires of which he was conscious, his only chance of gaining a thorough grasp of his art, and taking a high stand in his profession, lay in foreign travel. Without it he might have had the certainty of a respectable position and sufficient emoluments in his profession; with it he took the risk of delay and difficulty, and the chance of a noble career. The choice was not likely to cause him much hesitation. He decided at once, and kept to his decision firmly in spite of the natural remonstrances of his family, who felt the risk, but did not understand the necessity." "It seemed madness to risk on it so much of his slender resources." We then get a glimpse of him on his travels, "one day of which [to use his own constant expression] was worth a year at home."

The following passage, too, is interesting to us, relating how, when in Greece, "a change and growth of artistic power in him struck his fellow-travellers. Before he left Rome his drawings had been only careful and elaborate, now there began to show itself in them that indescribable power of insight and imagination which distinguished the true artist from the mere draughtsman." "Labour and ineffective drawing gave place to a bold and masterly grasp of the leading lines and the general effect of the scene represented. The progress once begun never ceased."

Of the necessity for travel that Barry felt then we ought to have no manner of doubt now. Every day it seems to be more generally understood, that the first thing necessary for good archi-

itecture is, that the architects must be artists. Good designs are not to be produced by accident, any more than good pictures or good sculpture, but by men endowed with artistic ability, who have taken all care to cultivate it to the utmost. If, in the practice of this many-sided profession of ours, we must some of us despair, as well we may, of making ourselves equally masters of all the various branches at once, at least let us never forget that, though surveying may be done by a surveyor, engineering by an engineer, contracts drawn up by a lawyer, and property looked after by an estate agent, architecture can be produced *only* by an architect. No one can take his place in that, and on him alone it depends whether the work is worthy to be so called. Nor need we wait for the revival of any more styles, or even the production of a new one. That will take care of itself. To begin with, it is not so much the style that is wanted, as the men!

The PRESIDENT in opening the discussion alluded to the value of sketches over photographs, and said that though no doubt it was useful for an architect to have a collection, photographs could never replace the value of sketching, which produced an impression on the mind which could be got in no other way. Attention to proportions could not be too much insisted on, without which drawings however otherwise clever, were almost valueless. He was disposed to take exception to what had seemed to him rather a disparagement of the value of measured drawings. The architect had to produce his effects in brick and stone, and for this the best training was the practice of measuring and plotting. This did not supplant the value of sketching, which could come afterwards.

MR. STANNUS, who proposed a vote of thanks for the paper, remarked that it was questionable whether sketching or measured drawing should come first. Only by making a perspective sketch of a building did the student come to see how the results in the finished work had been obtained. The perspective sketch, however roughly done, should he thought come first, and a measured sketch might follow. Measured drawings, in the sense of more finished drawings, would only be made where an authentic record of a building was required.

MR. GOTCH observed that Mr. Millard had started by saying there were persons who affected a disinclination for sketching. If the facts were known, these people ought probably to say that they could not sketch. There were persons who could never get into the way of sketching, and he would advise such persons not to try. He would not be inclined to lay down many laws, or any particular system of operation for a young sketcher; he would soon find out if he were capable of sketching, and would find out also what mode of working suited him best. Mr. Gotch, after saying that he agreed with the remarks made by the previous speaker, spoke of the materials to be employed, and recommended the use of ink in preference to pencil sketching, as it conducted to a habit of quick and ready sketching, and a power of expressing in a few lines what was wanted to be expressed. India-rubber was always at hand as a refuge in pencil drawing; but, in pen and ink, lines could not be multiplied without making a blotted drawing. Too much time, however, could not be spent in order to acquire accuracy; the sketcher if not accurate had better not sketch at all. The extra time spent would also prevent the student getting together more than he could digest; half a dozen sketches, thoroughly mastered, were worth dozens of which one could make neither head or tail a few months after they were done. It was also advantageous to go into the archæological part of the subject, as the value of sketching was simply to ascertain the spirit that moved the builders, to learn the why and the wherefore of the features of the building. It would be no bad plan if pupils, as a part of their training, were sent out in office hours to sketch anything within easy reach. Above all things, people should not be bored into sketching, but allowed to follow their inclination as to whether they would sketch or not.

MR. BAGGALLAY said he believed Mr. Millard meant that it would be waste of time to spend a week over measuring a building after one had acquired the power of drawing. There was no reason for such immense accuracy, when all that was wanted was a design of the whole building, or the grouping, or proportion, or some particular part. A perspective sketch with a note or two alongside for reference gave all that was wanted, and it was done in a shorter time. Speaking of the "Sketch Book," Mr. Baggallay said they desired not only to keep up, but to raise the character of the book, and this could not be done as long as so few of the nine hundred members of the Association contributed sketches.

MR. A. B. PITE wished that allusion had been made to Mr. Street and Mr. Burges. He thought there could be no better guide to a young sketcher than the first lecture of Mr. Street's series at the Royal Academy. The preface of Mr. Burges' book should be read to them in public. There was also Pugin's "Recollections," a work that had even stirred up Mr. Ruskin himself.

MR. CRESSWELL seconded the vote of thanks, and mentioned the advice given by Mr. Waterhouse, that water-colour drawing should not be neglected by a student of architecture, the study of colour being scarcely secondary to that of form. Measured drawing no doubt should be made, but when they went sketching they went also for relaxation after several months' work.

MR. W. H. ATKIN BERRY, hon. secretary, said there were sketches and sketches; there was, moreover, a limit to sketching.

In the present day they could not be architects in theory only, but must meet the practical requirements that came before them from day to day. It was quite possible to heap up large amounts of elaborate but useful drawings; the labour wasted in competition drawings was horrible to contemplate.

Several other members joined in the discussion, and among them, Mr. Sirr, Mr. Petrie, and Mr. J. A. Reeve.

Mr. H. H. KEMP, alluding to some previous remarks on pretty drawings, said that a competitor would have little chance of getting the premium if he did not send in a pretty drawing; at the same time he agreed that there was often a great waste of time expended on making merely clever drawings.

Mr. HOOPER said it was desirable, when sketching, to make notes of the materials used in the construction of the buildings, variations of quality, power of resisting the weather, &c. Wherever materials varied, style and treatment varied also.

The vote was then put to the meeting and Mr. Millard replied.

Previous to adjourning the meeting, Mr. Berry, the hon. secretary, stated that a roll of drawings left in the committee room on April 27 was missing. Possibly some gentleman might have taken it by mistake for his own, and have put it away unopened.

SMOKE ABATEMENT.

ON Monday a lecture was delivered before the Royal Dublin Society by Professor Barrett, in which he referred to the experiments instituted by the Smoke Abatement Committee at South Kensington on a series of closed and open gas stoves. To obtain comparative results a series of small testing-rooms were built—15 cube, with wall and floors of solid concrete, each with a small window and door of similar size, and each provided with a machinery 25 feet high. Thermometers were placed in each room, at different levels, and the amount of heat imparted to the air, as well as that radiated into the room by each grate, was carefully tested. The temperature in the chimney and the velocity of the draught were also measured. There was also a series of most exhaustive experiments made as to the composition and amount of the various gases withdrawn from the flues to which the grates and stoves were attached. Finally, the amount of coal consumed and the average shade of smoke discharged from the chimney was noted in each case. The duration of each test was from five to six hours, and the exhibitor of each stove was allowed to be present during the time of trial. So as to obtain the best results from each grate, one hundred and thirty tests of open grates and close grates were made and recorded. The open grates were divided into five classes—(1) those having the ordinary construction; (2) those having solid floors, not grids, for slow construction; (3) those supplied with fresh fuel beneath the glowing fuel or “under-fed grates”; (4) those in which the fuel is supplied from the back or sides; and those having a downward or backward draught. In Class 6 were embraced all the close stoves. Summarising the results of the tests in each class they had the following figures: Class 1, average weight of coal consumed, 4.32 lbs.; average temperature outside, 42.3° Fahr.; average temperature in a room of 6 feet high, 58.37°; rise of temperature per lb. of coal used per hour, 2.88° Fahr.

ANCIENT GREEK ART.

A LECTURE was delivered in the Museum Buildings, Dublin, on Saturday by Professor Mahaffy, F.T.C.D., upon Greek Art. The lecturer said that whatever rank ancient Greece might hold in the world's estimation in the domains of politics, war, and science, its supremacy in art—in poetry, sculpture, and architecture—was unchallenged and unquestioned. The creations of Greek art were, even to the present day, admitted to be the proudest monuments of genius—the acme of all that the sculptor, the architect, and the poet had yet accomplished, and the standard by which all existing works of art must be tried and verified. Greek art included several branches—poetry, painting, music, sculpture, architecture, and design; and this latter was again subdivided into ornament and decoration. Greek poetry was outside the scope of the present lecture; and as for Greek music, it had unfortunately almost entirely disappeared in the ravages of time, and the fragments that remained were so broken and disconnected that little or nothing could be gleaned from them of the state of musical knowledge among that ancient people. Of Grecian painting, too, scarcely a trace had been preserved; and, with the exception of some arabesques from the baths of Titus and Tivoli, and some decorative ornamentations and sign paintings unearthed from the buried ruins of Pompeii, there was nothing but traditions by which to form a judgment of what Greek painters accomplished. Of the three other branches of Greek art, however—sculpture, decoration, and design—examples had come down to us, numerous and complete, and precious enough to allow Grecian art to be judged of on its merits. Examples of prehistoric Argolic remains had been recovered mainly by the self-denying patience and industry of Schliemann. As illustrating early Greek art, throwing light on its history and explaining

obscure and difficult passages of poetry, the value of these discoveries could hardly be over-estimated. From the Homeric poems it was evident that Argos and Mycenæ were among the earliest centres of Grecian civilisation. An illustration of ancient Greek architecture called the “Beehive Building” was projected upon a screen, and the lecturer pointed out its characteristics, and observed that it was one of the earliest examples of Greek structural art extant at the present day. It would be observed that the stones of which it was composed were of very large size, and uncut, reminding the beholder of the description given by the Greek poet of the walls of Tyrins, the stones of which were so large and massive that a team of mules was unable to draw one of them. The doorway of this building was bridged over by an immense block of stone, and in the centre of the wall over the stone a large triangular space was left to lessen the weight of the superstructure, beneath which the stone might otherwise have been in danger of fracture. One of the earliest attempts at the formation of the arch was also exhibited, composed of a series of large stones overlapping each other, until they finally met at the apex of a triangle. Numerous other illustrations were given, and the lecturer traced the progress of ancient Greek art, both sculptural and decorative, from its earliest and rudest beginnings to its later and more perfect developments. The gate of Mycenæ was exhibited with its walls of rough-hewn stone and heraldic sculpture over the entrance, depicting two lions. It was believed that at the time this gate was built the sculptors of Argolis were unequal to the representation of animal forms, and that the lions which surmounted the entrance gate had to be imported from abroad, as such designs were not to be found in any contemporary Greek remains as yet discovered. The surfaces of those ancient buildings and temples were generally decorated in several ways, either by colouring, by carvings, or by covering them with metallic plates. This latter mode was frequently adopted in early Greek temples; but in the choice of designs for decoration it was curious what a variety existed between different nations, some excelling in depicting human or animal forms, while others preferred combinations of geometrical figures. It was remarkable that at the present day while among northern nations, even the various tribes of Esquimaux and the inhabitants of Greenland, the human figure and animal portraiture were the leading features in decoration, the case was quite different with the nations of the south—the Fiji and South Sea Islander decorating his weapons and his articles of adornment with geometrical figures, often of curious complexity and beauty, and manifesting much fertility of invention in their combination. A similar observation applied to some of the more ancient forms of Classic art. While manifesting great ability and genius in the adaptation of geometrical figures, curves and spirals, to the purpose of decoration, the artists of those periods appeared wholly unable to delineate the human figure, and their attempts at animal and human portraiture were of the rudest and most inaccurate, and sometimes ludicrous description. In illustration of this remark several specimens of ancient art from the Schliemann collection were projected on the screen, consisting of vases, cups, armour, and metallic plates and other relics. In conclusion, Professor Mahaffy asked his hearers, and through them he appealed to the Irish public, to supply a want greatly and unceasingly felt—that of an art museum—as one of the departments of the University. During the last ten years the University of Dublin was assuming a more peculiar position in Ireland as a great teaching institution, and not merely as an examining board—as the representative of real educational and intellectual culture, and not that mock culture produced by those cramming processes which the system of competitive examinations had fostered and made successful. The effect of recent endowments made by the State had been to lead many of the educational establishments in Ireland to devote almost their entire energies to the work of cramming students for competitive examinations. The results were fatal in many respects to real intellectual culture, and he was quite sure the effect had been injurious in many ways to Irish schools. He had nothing whatever to say against the eminent men who sat upon those boards of education; but no one could carefully study the working of the system without coming to the conclusion that the greater portion of Irish parents were only too much disposed to sacrifice before the juggernaut of the day the intellectual life of their children. To supply some remedy for these things was one of the aims and objects of this University and of these courses of lectures, especially by diffusing information upon branches of knowledge which had the inestimable advantage of not being included in the course of competitive examinations, which should therefore be studied and learned for their own sake, and in which no money prizes or emoluments would be gained by successful competition. They had seen during the lecture just delivered some interesting representations of ancient art, which had explained and rendered intelligible portions of his lecture they could not have adequately understood without such illustrations. But what was wanted was a gallery or museum of casts and examples of ancient art, so that in future when lectures on such subjects were delivered they would not be restricted to a transient and temporary view of them, but would be able to walk up and down the gallery and observe, study, compare, and contrast these specimens at their

leisure. Lately the Professor of Ecclesiastical History had appealed for an Art Museum to be added as a department of the University, and pointed out how difficult, if not impossible, it was adequately to study these subjects without such an adjunct. Not to have such a museum was a disgrace to the University, and he hoped that all those who took an interest in intellectual culture and in the real education of the people would give their assistance in supplying a want which was so much felt.

DARLINGTON PROPOSED FREE LIBRARY.

A SPECIAL meeting of the committee appointed at the last meeting of the Darlington Town Council has been held to receive further information from Mr. A. Pease, M.P., in reference to this proposed gift to Darlington. It will be remembered that in pursuance of the wishes of the late Mr. Edward Pease, Sir Joseph Pease, M.P., as one of the executors, had offered to erect and furnish free library buildings. Mr. A. Pease gave the committee complete information with reference to the proposal, and placed drawings before them showing the site and general plan of the buildings, which had been prepared by Mr. G. G. Hoskins, F.R.I.B.A., of Darlington, who has made the most of the site, and has designed an admirably-arranged building suitable in every respect to the purpose. The site offered by the Messrs. Pease is on the large vacant piece of ground in Crown Street. The Free Library would be erected at the north end of the plot, and the main entrance would face directly up Crown Street and towards Northgate, from whence a capital view of the library could be obtained.

The buildings are extensive, and would doubtless form a striking architectural feature in the town, besides worthily perpetuating the name of the gentleman to whose liberality the borough is indebted for the offer of them.

The proposed buildings extend 100 feet, by a depth varying from 88 feet to 66 feet, and the ground plan shows a commodious porch, which leads into a vestibule almost co-extensive, thence into a large public space. Immediately facing this is a semi-circular counter for the librarian, at which books will be delivered to borrowers. To the right is a ladies' reading-room, 21 feet 6 inches by 16 feet, and further, in the same direction, is a large general reading-room, 50 feet by 30 feet. To the left of the vestibule is a committee or writing-room, 21 feet 6 inches by 16 feet, and a students' room, 37 feet 6 inches by 30 feet. Immediately behind the librarian's desk, and running parallel with the general reading-room, is the library, 52 feet by 30 feet. Behind the library are arrangements for heating-chamber, yard, coal-house, &c. Lavatories are supplied in various parts of the building, and the arrangements are of the most convenient character. It is to be hoped that there will be no hesitation in the town to adopt the Free Libraries Act, and to accept this splendid gift placed at its disposal.

CHURCH EXTENSION.

THE annual meeting of the Incorporated Church Building Society was held a few days ago at the Sanctuary, Westminster. The secretary reported that from the general fund aid had been sought by 102 applicants; 22 grants had been made towards building additional churches, 11 towards rebuilding existing churches, and 54 for enlarging or increasing accommodation in existing churches. For mission buildings 38 applications had been received, and grants had been made towards 37 mission churches, temporary churches, or hamlet chapels. The total estimated cost of the works proposed to be executed last year was 253,093*l*. The Bishop of St. Albans stated that the society had suffered from a long period of depression. For some time past there had been a growing feeling against building. He had found that many charitable persons, who were ready to give their money in support of living agencies—for the employment of clergymen, readers, and women to be engaged in pious works—had expressly requested that their subscriptions should not be used for building churches, chapels, schools, or even mission rooms. But the time had arrived when church people should have it impressed upon them that churches and mission rooms must be built. In his own diocese an appeal had been made for building or enlarging six churches, and the population was growing so rapidly that the churches must be provided for them. He then alluded to the condition of the clergy as having been very injuriously affected owing to the depressed state of agriculture. Lord Dartmouth, who moved the adoption of the report, also stated that owing to the state of agriculture the clergy in many parts of the country had had to struggle with adversity. Except that so many of them were not desirous of parading their troubles, it was surprising to him that more had not been heard of the depression which had for so long weighed upon those who had charge of parishes in various parts of the country. Colonel Clive, M.P., after the report was adopted, moved, and it was resolved, as follows: "That this meeting, while thankfully acknowledging the valuable aid that the society has been able to render in past years to the cause of church

extension, and having in view the continued demands for its assistance, desire to impress upon church people the importance of contributing to its funds in order to enhance its usefulness in promoting the erection of churches and the provision of mission buildings."

CINQUE CENTO MEDALS.

THE collection of Italian medals formed by Sir W. Fettes Douglas, P.R.S.A., which was sold last week at Christie's, was one of considerable interest, as it contained some very fine examples, and a few which were admitted to be among the finest pieces known. There were also some German medallions and medals of rare excellence, and many plaques and plaquettes. The finest of the Italian medals were by Vittore Pisano: *Malatesta Novello*, 1429-65, slightly imperfect, 20*l*.; by Matteo de Pasti, *Malatesta, Lord of Rimini*, 1417-68, 29*l*.; by Elia de Janua, *circa* 1480, *Fregoso, Doge of Genoa*, 1478, size 43 mill., 40*l*.; Gentile Bellini, *Mahomed II., Emperor*, 1443-81, a very fine example, size 93 mill., 85*l*.; Melioli, *circa* 1481, *Christian I. of Denmark*, 22*l*.; Le Médailleur à l'Espérance, *circa* 1489, *Roberto di Dante*, 19*l*.; *S. Camilla Buondelmonti*, by the same artist, size 91 mill., said to be one of the finest known, 98*l*.; Benvenuto Cellini (attributed to him), *Jean, Cardinal of Lorraine*, 26*l*.; *Aretino*, the poet, size 58 mill., 28*l*.; Leone Leoni, *Martin de Hanna*, a rare medal, 1475-53, 34*l*.; Aboudio, 1538-91, *Jacopo da Trezzo*, the engraver and medalist, size 70 mill., 29*l*. By anonymous medallists—*Antony, Grand Batard de Bourgogne*, 1421-1504, size 42 mill., 20*l*.; *Niccole Tempe*, 27*l*.; *Pantiatichi*, a Florentine, 1468, 20*l*.; *Gonzaga, fifth Marquis of Mantua*, 1500-40, on the reverse, *Mount Olympus*, with statue of Faith, size 57 mill., 31*l*. Unpublished medals by unknown artists—*Butrigario and his Brother Hercules*, by a Bolognese artist, a fine and important medal, size 85 mill., bust on obverse and reverse, 110*l*.; *Leonardo Zantani*, 43*l*.; *Albert Litta*, 1565, 15*l*.; *Julia Orsini*, 1537, reverse plain, size 51 mill., 17*l*. German medals—*Maximilian*, high relief, three-quarter face, in hat and plume, size 80 mill., 65*l*.; *Albrecht of Brandenburg*, Cardinal Archbishop of Mayence, size 44 mill., 22*l*.; *Alexander Balbian*, reverse plain, size 57 mill., 20*l*.; *Hans Cristof Löffel*, youthful bust, size 37 mill., a fine and perfect medal, 92*l*. The plaques brought comparatively small prices generally, but a head of *Medusa*, size 80 mill. by 65 mill., brought 14*l*. 10*s*., and the *Adoration of the Shepherds*, after the picture by Mazzuoli, size 198 mill. by 142 mill., 21*l*. The collection (211 lots) sold for 1,471*l*. 13*s*. 6*d*.

MANCHESTER SCHOOL OF ART.

A SPECIAL meeting of subscribers to the Manchester School of Art was held on Tuesday, in order to adopt a trust deed for the school and to appoint trustees. Mr. F. W. Grafton, M.P., chairman of the council, presided, and explained that as the school had become possessed of property in the shape of land and buildings it was necessary to have a formal registration of such matters, and to appoint gentlemen to act as trustees.

Mr. James Murgatroyd, at the request of the chairman, made a brief statement, in which he said that when it was found necessary to remove the school from the Royal Institution about 3,000 square yards of land were purchased, of which about 1,200 yards were appropriated as the site of the new school. There was at the rear of those buildings between 1,700 and 1,800 yards which would be available for future wants. The land had been conveyed to Mr. Grafton, and upon it the council had erected buildings which, with the interest that had been paid to the bankers, the cost of removal and other things, and the cost of the land, represented an expenditure of about 28,600*l*. Having property to that extent it was necessary that it should be vested in some permanent body, and the objects for which it was vested in them should be clearly expressed. Accordingly the draft of a trust deed had been drawn up, under which the property would be transferred from Mr. Grafton to the trustees. Those trustees, it was proposed, should be ten in number. Ten other gentlemen would be associated with them, and would, together with the ten trustees, constitute the council of management. The trust deed provided that the building should be used for the purpose of "teaching and promoting a knowledge of art, and of furthering its practical application." The trustees would not be obliged to continue any longer in office than they liked, and power was given to the remaining trustees to fill up any vacancy in their number. If they failed to do so then the vacancy was to be filled up at the next annual meeting of the council of management. It was further provided that those who were entitled to vote should be persons who had given 20*l*. and upwards to the funds of the school, or who subscribed 2*l*. annually towards its maintenance. If at any time it should appear that the school was not fulfilling the purpose for which the trust was established, then, upon a requisition from the council of management, the property might be sold and the proceeds of the sale handed over to any other body which would undertake to carry out the objects mentioned in the trust deed—namely, teaching and promoting a knowledge of art, and furthering its practical applica-

tion. At the last annual meeting twenty gentlemen were chosen, and ten of them had kindly consented to allow themselves to be nominated as trustees. The other ten would serve as their colleagues on the council of management. He would therefore move that the following gentlemen should be appointed the first trustees of the school: Mr. James Chadwick, merchant; Mr. W. Graham Crum, calico printer; Mr. F. W. Grafton, calico printer; Dr. J. G. Greenwood, Vice-Chancellor of the Victoria University; Sir Joseph C. Lee, merchant; Mr. James Murgatroyd, architect; Mr. Charles J. Pooley, cotton spinner; Mr. T. R. Wilkinson, banker; Mr. Thomas Worthington, architect; and Mr. William A. Turner, cotton spinner.

Sir Joseph C. Lee proposed that the following gentlemen should be elected members of the council of management: Mr. George William Agnew, print seller; Mr. T. Gair Ashton, merchant; Mr. Edward Behrens, merchant; Mr. Edward Donner, merchant; Mr. Charles H. Nevill, calico printer; Mr. J. H. E. Partington, artist; Mr. Alfred Pilkington, colliery proprietor; Mr. C. P. Scott, gentleman; Mr. Joseph Waterhouse, banker; and Dr. John Watts, agent.

The motion was seconded by Mr. Worthington, and passed.

On the motion of the Chairman, seconded by Mr. Turner, the draft of the trust deed submitted was adopted.

The Chairman remarked that before the meeting terminated he would like to say that the council were very anxious, seeing that they were entering on a new lease of life, to do so free from debt. They were still endeavouring to wipe off a considerable balance, about 2,500*l.*, owing in connection with the building fund. There was also a sum of 600*l.* or 700*l.* owing on account of current expenses, which accumulated during the period when they were not so favourably circumstanced. The council hoped before long to make a clean sweep of those liabilities, and to be able to start afresh without any pecuniary difficulties before them.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Edinburgh Association a paper was read by Mr. R. Rowand Anderson, A.R.S.A., on "Early Renaissance Architecture in Italy." The author described the causes that led to the great architectural movement at the beginning of the fifteenth century. The characteristics of the mediæval architecture of Italy that prevailed up to the commencement of the Renaissance were explained, and it was shown that there was always a bias towards Roman art in it, and that the Italians never developed a consistent style of Gothic architecture, as was done by the other nations of Western Europe. The other causes were the political subdivision of Italy into numerous Republican centres, each keenly competing with one another, creating great independence of thought and individuality of character; the stimulus given to education by the Emperor Frederick II., and his contests with the Church; the enthusiasm for ancient learning of Petrarch, who was the first to suggest the foundation of public libraries. There was also his collection of coins and inscriptions, followed by the influence of Giovanni Boccaccio and Poggio Bracciolini, one of the greatest discoverers of ancient manuscripts; among others, the writings of Vitruvius Pollio, a Roman architect of the first century, whose writings on architecture have been the basis of all that has since been written on classic architecture. At the time the Medici family rose to eminence, Florence was the capital of culture and art in Italy, and that family gave the first great impulse to building in the new style. Mr. Anderson gave the names of the leading architects and their works, and showed the freedom of treatment both of plan and of elevation that prevailed then, but that gradually drifted into a dry and formal style, strictly regulated by academical formulæ, and eventually expiring in the barocco of the seventeenth century.

NEWCASTLE CATHEDRAL.

A MEETING of the executive committee for the restoration of St. Nicholas' Cathedral Church, Newcastle, was held on the 18th inst. The following letter was read from Mr. R. J. Johnson, the architect: "I have to thank you for your note formally announcing my appointment as architect for the further works to be undertaken at the cathedral. It was with much pleasure that I heard of the appointment, and I sincerely trust we may be able to carry the work to a successful issue. Our cathedral is not comparatively a large one, but for congregational purposes it is more useful than many of more sumptuous architectural character, and Mr. Westmacott's handsome gift may, I trust, strike the key-note for the character of the remaining fittings; so that, as far as we go, the church may be as beautiful and perfect as any." The following resolution was adopted: "That the scheme be called the Restoration of the Cathedral Church of St. Nicholas, and that the object of the executive committee shall be to carry it out, under the advice of the architect (Mr. R. J. Johnson), in such order and manner as will prove most conducive to its early accomplishment, so that St. Nicholas' may become in every

respect fully adapted to meet its present and future requirements. That all subscriptions received in support thereof shall be paid to the credit of the fund with Messrs. Lambton & Co., bankers, of this city, or at any of their branches, and applied exclusively in payment of such expenditure as may be sanctioned by the executive committee in carrying out the works. That no member of the executive, financial, or general committee shall incur any responsibility beyond the amount of his subscription. That in any contracts that may be entered into care be taken to guard against such liability. That no payment shall be made unless sanctioned by the executive committee, and then by cheques only, signed by three members of the said committee, countersigned by one of the honorary secretaries, and made payable to the order of the party entitled to receive the same. That the presence of five members be required to constitute a quorum, and that all questions be determined by a majority thereof, the chairman for the time being having a casting vote if necessary." The architect was instructed to prepare a report, plans, and estimates showing generally how he proposed to deal with the subject, which, when ready, will receive the consideration of the committee.

Architecture at the Academy.

SIR,—I entirely agree with your correspondent, "A Provincial F.R.I.B.A." The present exhibition of architectural drawings is disgraceful, not to the architects of the country, but to the Royal Academy, and is calculated to do our profession a great deal more harm than good.

There are in all 124 drawings exhibited. Of these 21 are *not* architectural drawings, and ought not to have been hung; 33 are devoid of merit, and distinctly inferior to drawings which were sent in, but rejected; 15 are drawings of considerable merit, as drawings which might be admissible if the committee were at a loss how to fill up superabundant space; and, lastly, out of the whole 124 there remain only 55 which seem at all worthy of being placed in such an exhibition, and even of these many are of an exceedingly commonplace character.

As the selecting committee sent back provincial works almost without exception, it may be some consolation to your correspondent to reflect that the miserable exhibition this year gives no idea of what is being done in the provinces; it shows, in short, not the best architecture of the country, but only what Royal Academicians consider to be the best that metropolitan architects can produce. Is it really so?

Your obedient servant,
F.R.I.B.A.

SIR,—There is one peculiarity in the present exhibition of the Academy which your correspondents of last week have overlooked, and that is the fictitious character of some of the drawings. A slight scrutiny is enough to reveal to the initiated that there are buildings appearing on the walls which may be classed with the palace by the Lake of Como, described by Claude Melnotte in the "Lady of Lyons." Imagination is in its way an excellent thing, and to the mind of an Academician it may seem to have as much right to assert itself in Gallery X., as among the sculpture in the central hall or the paintings in the remaining rooms. But architects, at least, expect that what is represented as architecture should have some relation to clients and builders, which, unless I am mistaken, is not the case with many of the works in the present exhibition.

It would be interesting to know what test was applied this year to ascertain the quality of the drawings. It may have been a painters and sculptors' test of the figures in the foregrounds, but otherwise it is incomprehensible to an architect. People who have not seen them can hardly imagine how excellent were some of the drawings which the Academicians declined to hang. Some of them were by men whose position was sufficient to entitle their buildings to be classed as *hors concours*. The character of the rejected drawings proves that the selection could not have been undertaken by one of the architects who are Academicians. There may have been some reason for assigning the office to painters and sculptors, but if architects were not eligible to be members of the committee of the selection, it would have been easy for the Academicians to have obtained the advice of the master in the class of architecture, a gentleman in whose honesty and impartiality all of us have confidence.

Your obedient servant,
ONE OF THE REJECTED.

The O'Connell Monument, in Dublin, has been completed this week. It has been in hand for nearly twenty years. The monument was designed by the late John Henry Foley, R.A., and on his death was completed by Mr. Brock.

NEW BUILDINGS.

Headingley.—A sanatorium in connection with the Orphan Homes, Headingley, has been opened. The building provides accommodation for about twenty children, besides the matron. The exterior of the building is designed in a half-timbered Domestic Gothic style, somewhat after the manner of the sixteenth-century country houses in Cheshire and the Midland counties. An arcaded wooden verandah runs along the west front, forming a pleasant sheltered recess in which the children may sit. The building is carried out in brickwork of a deep red colour, red terracotta from Messrs. Wilcock & Co., of Burmantofts, being used for the mullioned and transomed bay windows, string-courses, and other features. The woodwork in the overhanging gables, verandah, and other parts of the exterior is painted in an artistic shade of peacock blueish-grey, the cemented panels being finished a vellum tint. The ground floor contains the following: Vestibule and spacious interior hall; convalescent-room, 18 feet 6 inches by 15 feet, with large bay to south; matron's-room, 15 feet by 14 feet 6 inches, with large bay window facing the west; kitchen, 15 feet by 13 feet 6 inches; store-room, larder, scullery, and coal-place. The first floor comprises two large, well-lighted dormitories, one for boys (size, 19 feet by 15 feet), the other for girls (18 feet 6 inches by 15 feet), the matron's bedroom being placed between the two, and having small windows looking into each apartment, to be used for supervision purposes. The remaining floor-space is utilised for bath-room and lavatories, linen store-room, and other necessary accommodation. On the second floor are two bedrooms, the larger one for children, and the other for the domestics. The interior is chiefly noticeable for the rather unique style in which the woodwork and walls are painted and coloured. The woodwork of the hall, staircase, and upper landings is painted the colour of Japanese red lacquer; the bedrooms are painted a quaint shade of blueish-grey; a sage-green leather colour is adopted for the matron's and convalescent-rooms, and a serviceable brown for the other departments. All the ceilings are finished in cream colour, a pale shade of Pompeian red and a quiet tone of greenish drab being used for the various wall surfaces. The vestibule, hall, kitchen, and verandah floors are paved with red tiles. Noticeable features in the convalescent and matron's-rooms are two chimney-pieces, specially designed by the architect, constructed in celadon green-glazed Burmantofts faïence. The gas-fittings, of artistic design, in brown bronze and wrought iron, finished black, were provided by Messrs. Strode & Co., of London. The leaded stained-glass staircase window came from the *atelier* of Messrs. Powell Brothers, of Leeds. The work has been carried out from the designs and under the superintendence of Mr. William H. Thorp, Associate and Graduate R.I.B.A., of St. Andrew's Chambers, Park Row, Leeds. The contractors for the work were: Mr. John Pickard, Dorrington Street, mason and bricklayer; Messrs. Eddison Brothers, Kirkstall, carpenters and joiners; Mr. James Season, Hunslet Lane, slater; Messrs. Barrand Brothers, Carlton Hill, plumbers and glaziers; Mr. William Holdsworth, Leighton Lane, plasterer; Mr. J. Walker, Headingley, painter. The total expenditure, including architect's commission, gas-fittings, road-making, &c., amounts to 973*l.* 11*s.*

SCHOOL BUILDINGS.

Westfield.—Infant schools, accommodating 250 children, were commenced on the 14th inst. at Westfield, for the Workington School Board, from plans and specifications furnished by Mr. James Howes, architect, Workington, in a recent competition. The successful plans, &c., are being used without alteration at a cost of under 2*l.* 19*s.* per head.

Heworth, near Gateshead-on-Tyne.—The sixth block of school buildings erected by the Heworth School Board at Windy Nook has just been opened. The new buildings are on an open site to the east of the village, and are built entirely of stone. A lofty bell turret surmounts the main roof, and the buildings form a pleasing and substantial group. Accommodation is provided for 450 children. Private rooms are attached to each department for the use of the teachers, and cap-rooms and lavatories for the children. Provision is also made for a caretaker to reside near the premises in a detached cottage. The buildings are heated throughout by means of hot water in pipes and coils, and special attention has been given to the ventilation of the school-rooms. The works have been carried out in a satisfactory manner by Messrs. Greason & Stockdale, of Gateshead, their sub-contractors being Mr. Hutchinson, mason; Mr. Rule, plasterer; Mr. Blenkley, plumber; Mr. Burn, slater; Mr. Almond, painter and glazier; and Messrs. Walker & Emley, hot-water engineers. Messrs. Oliver & Leeson, of Newcastle-on-Tyne, are the architects.

Gateshead.—The building known as the "High School for Boys" was opened last week. The building stands on a site of seven acres, sloping to the south and west, with a sunny aspect and overlooking Ravensworth Vale, and passing the gateway by a porter's lodge the school is reached. It is built of red brick, with stone dressings in the Tudor style, with diapered slate roof. At a prominent corner of the building stands out in bold relief a massive

tower, in which it is proposed to place a large illuminated clock. Underneath is an observatory, which not only commands a beautiful view of the surrounding country, but will also be suitable for the instruction of the youths in the study of astronomy. The interior of the building is thus arranged. There are six class-rooms, each of which is arranged for the use of thirty boys, a classroom for sixty boys, and a large chemical laboratory. In the centre of the building is a large assemblage hall capable of seating between three hundred and four hundred people and a dining hall for youths attending the school from a distance. Not far apart are the private rooms for the head and under masters, the library, and a room for conversation. Underneath are capacious kitchens and sculleries. In each of the rooms are open fireplaces, and they are lighted in such a manner as to cause the light to fall on the left hand side of the occupants. Besides this, arrangements are made for maintaining an equable temperature throughout the building by means of hot water pipes. The head master, the Rev. Thomas Adams, intends, we understand, to erect a house for the accommodation of a large number of boarders, on the Eton principle. It is also intended to build a large gymnasium, a cricket pavilion, and workshops, in which pupils will be taught carving, joiner-work, and other trades, the idea being that each boy shall learn some handicraft in addition to a first-class education. Messrs. Oliver & Leeson, of Newcastle, are the architects; Mr. J. S. Millar, the contractor, and Mr. David Lindsay, the clerk of the works.

CHURCH BUILDING AND RESTORATION.

Silloth.—The tower and spire of Christ Church is to be completed, and the work has been commenced. The height of the spire will be 74 feet, making the total height of the structure when completed 130 feet. The materials used in its construction are Shawk stone and granite, the former being used for the facings. Mr. C. J. Ferguson, Carlisle, is the architect for the work, and the contractors are Messrs. J. & W. Beatty.

Stourport.—The memorial-stone of a Baptist chapel has been laid. The designs for the building are by Messrs. Ingall & Hughes, of Birmingham, and the builders are Messrs. Smallwood & Co., of Wootton Waven, Warwickshire. The chapel, when finished, will seat 300 persons. The style is Gothic, the materials being red brick, with Bath stone dressing and moulded bricks.

GENERAL.

Mr. Frank Holl, R.A., has obtained the commission to paint the presentation portrait of the Archbishop of York.

Three Churches are to be erected in Gateshead, and at a meeting held on Tuesday subscriptions for the project were invited.

The Mold Market Hall is to be reconstructed according to plans by Mr. Walker, architect, of Dale Street, Liverpool, which have been selected in competition.

The Annual Exhibition of the Liverpool Society of Painters in Water-Colours was opened on Monday. There are 387 drawings, against 323 exhibited last year.

"Ladbury's Cottage," one of the oldest houses in Rochester, and a favourite subject for the artist's pencil, is now being taken down, the building having become too dilapidated to stand.

A Reredos and Transept Screens in English oak are about to be erected in the Church of Ascension, Lower Broughton, by Earp, Son, & Hobbs, sculptors, of London and Manchester, from the designs of Messrs. Colley & Brooke, architects, of Manchester.

The Tait Memorial Committee at Canterbury have received designs for the proposed sedilia in the cathedral from Mr. H. G. Austin and Mr. Cowell, of Canterbury, and Mr. J. O. Scott and Mr. A. W. Blomfield, of London. But no design is likely to be adopted, as the local memorial is to be a reredos.

An Irish Cross has been erected in Glasnevin Cemetery, Dublin, as a memorial of the late Mr. T. H. Burke, under-secretary to the Lord-Lieutenant. It was designed by Mr. Thomas H. Drew, R.H.A., architect, and has been constructed at the cost of some of the resident magistrates.

Messrs. Robert Boyle & Son's system of ventilation is being applied to the new hall of the Medical Society of London; Christ's Hospital (Bluecoat Boys); German Hospital; new police station, Shepherd's Bush; new police station, Hornsey; law courts, Salisbury; and new naval barracks, Keyham, Portsmouth.

Messrs. Measures Bros. & Co. have been selected in competition to supply and fix the constructional ironwork for Messrs. Foster, Porter & Co.'s new premises. We believe this is the sixth case within the last few months in which this firm have had the reconstruction of buildings in ironwork which had been destroyed by fire.

The Plans of Messrs. Horton & Bridgford, architects, of Manchester, for the proposed new block of diocesan buildings in King Street and South King Street, have been selected by the Directors of the Manchester Diocesan Buildings Company, Limited. In the selection of the plans Mr. James Murgatroyd acted as referee.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MAY 26, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden-block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the

risers are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK.

Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

ARCHITECTURE AT THE ROYAL ACADEMY.

THE correspondence which we have published on the subject of the remarkably poor character of the collection of architectural drawings exhibited this year at the Academy tells its own tale, so far as regards the dissatisfaction for the moment of those who are displeased with the show, and of those others also who are still more displeased with the exclusion of works of their own,

which would at least have helped to increase the quantity, without, we may safely suppose, deteriorating its quality. Certainly the show is the poorest that has been seen for many years, we may say for any number of years. Such exhibitors as STREET and BURGESS, only lately lost, carry us back to SCOTT; SCOTT to BARRY; and BARRY to COCKERELL and the *dilettanti*; while the names of SOANE and GANDY-DEERING remind us of even remoter times, when the "architectural room," if it contained fewer specimens of the picturesque *en petite*, now so absorbing, was in a great measure filled up with the Classical *en grande*, perhaps all the more showable because it was so often more imaginative than real. But it is not to individual discontent or to general dissatisfaction that we would now wish to direct attention; the more important question, as it seems to us, is whether the striking failure to produce even a makeshift exhibition of architectural work at the Academy this year has anything to teach us by way of a lesson. For it must be remembered that this failure is not quite sudden, but has been threatening for years back. It is stated by some apologists that on the present occasion the *fiasco* is due to the accidental absence of the architectural members at the first separation of the sheep from the goats by the Academy Council; but we cannot accept this as an adequate cause; it does not account for the almost total absence of superior work or the almost exclusive presence of inferior. It is quite likely that some good work may have been thus rejected, and some bad accepted, but to suppose that so very nearly all the good has gone out, and so very nearly all the bad come in, is impossible. The profession of architects at large have this year signally failed in their exhibition of art, and this is the plain English of the misadventure.

May we hope to be permitted without offence to remind our readers that the Academy Exhibition is a commercial affair? In what is a commercial country *par excellence*, this ought perhaps to be all the more readily acknowledged as matter of fact; even if, as matter of sentiment, many people think it necessary to do their best to ignore it. Money makes, not only the mare, but the picture to go. Even the excellent President himself must "sell"; and if there be any one so supremely blest as to sell altogether out of the Exhibition, yet even he might soon cease to sell if he ceased to exhibit. The encouragement of art for art's sake is no doubt a prodigiously fine thing to talk about, but the artist's banking account is the only substantial outcome of it all.

In respect of architecture the commercial element, we need not observe, does not exactly take the form of offering the exhibit for sale; even the most splendid of Sir GILBERT SCOTT's well-remembered big perspectives would not find house-room at any price in a drawing-room at Kensington or Mayfair. But in place of "selling" we have only to read another word, and the typical architect of the Academy Exhibition is simply he who chooses to spend a little money in advertising what he is doing. An attractive display attracts, not a crowd of wondering admirers of the art, but, if good luck so happens, a wandering client for the artist. Such clients, like those who come to writers of books, are seldom worth having, it is true; they are almost invariably eccentric and unmanageable people or they would not choose an architect in that way; but an advertisement at Burlington House is better, after all, than the struggle of a competition, and at any rate, if the exhibitor has friends to take an interest in his advancement, a successful display at the Academy affords them an opportunity of becoming impressed in his favour, and renders them better able to recommend him to their acquaintances. How, then, have the class of miscellaneous exhibitors in architecture been

circumstanced for the last four or five years as regards their means, of advertising themselves? Has anything particular happened which affects the advertisement? These are perfectly business-like questions, such as an experienced commercial man would no doubt suggest at once.

One answer seems to be that the mode of draughtsmanship—which not only has a great deal to do with the act of advertisement, but has more to do with it than anything else (and if this brings down the architectural value of the manifestation to a low level, we cannot help it)—has drifted into a certain form which has exhausted its power and become feeble and futile. Pen-and-ink etching has run its course. It set up Mr. STREET and his school. It has set up Mr. NORMAN SHAW and his. But the way in which Mr. ERNEST GEORGE is now handling it shows that it is not considered to be equal, pure and simple, to set him up in his turn, with his followers of a younger generation; and, as another instance, the terrific force of some late experiments, compared with which the boldest draughtsmanship of Mr. STREET or Mr. NORMAN SHAW dwindles to the daintiness of a crowquill, only goes to prove the same change; indeed, we might cite half a dozen other cases, all to show that architectural pen-and-ink, like many a better thing in art and many a worse, has had its day. But up to the present moment no successor to this mode has yet acquired shape. Mr. WATERHOUSE's peculiar foxy-brown water-colour, for instance, has no leadership in it whatever. The few attempts at a return to anything else of the nature of realistic pictures are both too small in size and too weak in execution to indicate even a hope of holding their heads up. The French elevation tinting does not put in an appearance. Pencil sketching, we presume, would scarcely be allowed admittance, nor such a thing as "chalks." What is to be the new draughtsmanship no one can tell. The hour will no doubt come, and the man; but as yet chaos reigns—a shabby little chaos of poor pen-and-ink scratching quite worn out. Last year, and the year or two before, people were tired of it, both those who looked at it and those who did it. This year the draughtsman seems not to have had the heart to try it any more; and if he had tried his best at it, his palpable weariness and discouragement would only have scared away the client instead of attracting him. This kind of action and reaction goes on in all matters of taste at all times, and there is nothing in it that need awaken the slightest feeling of mystery or sense of misgiving.

But there is another consideration to be remarked upon. The advertising architect—we speak of him with all respect—is no longer dependent upon the Academy as what is called a vehicle. He can do better in the public journals. His pen-and-ink etching is no longer a mere exhibit prepared at the risk of being skied, or floored, or altogether cast out, to be at the best left unregarded in public for three months, and then relegated to the office wall to be for ever unregarded in private; it is a thing to be reproduced by photo-lithography, not only with all the authenticity that the most self-assured could wish, but indeed (when well done) with even a better artistic expression; reproduced, moreover, in any number of copies, and distributed without even the cost of postage all over the accessible world. Compared with this, it is not at all to be wondered at that the "Academy drawing" of old time should have come to be disparaged as a matter of commercial business; and we have no hesitation in saying that this result has actually taken place, and is in a great measure to be accepted in explanation of the present and recent failures of the architectural room, especially if we look dispassionately at the circumstance also that for some years past leading architects have virtually ceased to exhibit, which seems to us to be the right way to interpret the facts of the case.

Perhaps it is worth while further to point out that an exhibition drawing, regarded as an advertisement, is of no use unless it be thoroughly well got up, and that to get it up thoroughly well costs a good deal of money. To appreciate the argument here, we must bear in mind that an advertiser, properly so-called, as a man of repute in business who has to keep his name before the public, is in quite a different position from the young aspirant who makes his own drawings without expense; he has to pay liberally if he would have creditable work to show, and all the more liberally because it is the excellence of the rendering which in the eyes of the public constitutes the excellence of the design. The money reckonings of the late Sir GILBERT SCOTT, prince of advertising architecture in its best and most successful form, were not

difficult to guess at in his day, and we may fancy that his unparalleled outlay in competitions had in reality not a little practical reference to the utilisation of the principal drawings for display at the Academy. How far the business of architectural solicitation has changed within the last few years such a suggestion as this may serve to indicate with still greater force. Shall we ever have such solicitation again—in other words, such well-conducted advertising?

There is much more that we might take leave to say upon the subject generally, but we ask our readers to look at the question for themselves in the proper light of a lesson for the consideration of the profession at large, and of individual professional men no less. The times are changing, and we must change with the times. View it as we may, the very remarkable failure of this exhibition and its immediate predecessors must have some important significance. Let it be hoped that the next few years may show at least that it is part of a process of artistic regeneration much needed. Before long it may probably be the general opinion of critics that pen-and-ink etching in sharp perspective is one of the weakest of all forms of architectural draughtsmanship although associating itself with some popular fashions of artistic design; and if the draughtsmanship is now to be discarded, the fashions may go with it all the more quickly.

SPANISH SKETCHES.*

THE exalted notion of the superiority of their own country which was held by Spaniards was balanced by the indifference of the remainder of Europe to everything Spanish with the exception of the wine. Spain was beyond the Grand Tour. The legends of its Inquisition, superstition, dirt, barbarity, and ignorance were enough to deter even the most venturesome; and there was a time when a visit to the country appeared to be more dangerous than a voyage to the interior of Africa is now. But as regards art Spain was, until a far later period, supposed to be a desert in which nothing was to be seen that would repay the expense and trouble of a journey. Fifty years ago WILKIE considered that he was entitled to the honours of BRUCE and MUNGO PARK because he ventured into a *terra incognita*, which was, he said, the Timbuctoo of painting. The gorgeous interiors of the cathedrals which were depicted by DAVID ROBERTS were not always accepted as realities by the public, for the simple reason that they had no means of verifying them. JOHN LEWIS and JOHN PHILLIP, in our own time, did most to convince English people of the picturesqueness of the Spanish scenes, and to demonstrate to painters by their own success the immense value of a study of Spanish pictures. Even when English authorities were compelled to admit that there were Spanish painters, they, however, maintained that there were no architects. FORD describes his amusement when, on turning to the "Encyclopædia Britannica" for information on the subject, he found it laid down in the most dogmatic way that Spain had not and could not have an architecture of its own, because the people were less patriotic than the French. In a much later edition of the same publication the architecture of Spain has six lines devoted to it. OWEN JONES, by a self-sacrifice that should always have recognition, made it plain that there was one building at least in Spain which was deserving of admiration, and Mr. STREET did much for Spanish Gothic. But with the exception of the sketches of Captain WIDRINGTON and G. F. SARGEANT, occasional plates in an "Annual," and the "Note Book" of Sir DIGBY WYATT, little was done to illustrate that Renaissance work which was adopted at a time when Spain was the most influential kingdom in the world.

The "Sketches in Spain," by Mr. BERNARD SMITH, will, in a great measure, supply the deficiency. As the author frankly admits, it is impossible to give an adequate idea of the numberless examples of the sixteenth-century buildings in the space afforded by thirty plates; but the examples which are shown may well be called typical, and there is no reason to consider the subject exhausted. Mr. SMITH will hereafter, we hope, be enabled to do much more towards the illustration of the Spanish Renaissance. He has already proved by his "Sketches in Germany and Switzerland" that he is an able draughtsman, and has the faculty of presenting those points in

a building which are most likely to be suggestive to a modern architect. The "Spanish Sketches" are if possible more vigorous than those in the companion volume, as the subjects seem to be especially suited to Mr. SMITH's style of drawing.

A book of this kind affords not only the pleasure which representations of good work must always afford, but at the present time it is, unless we are mistaken, likely to be more useful than the works of Mr. JONES and Mr. STREET were in their day. We are now in a transition period, and it is difficult to define what will be the next influence on English architecture. Is it absurd to suppose that one can see in Spanish Renaissance an attempt to deal with a state of things not much unlike that which is before English architects in the nineteenth century? Can we imagine that the sublime serenity of Greek work will be shortly appreciated in England as an architectural style should be that is generally used, or is it not more probable that for many a year to come it will appeal to reason rather than to feeling? A country in which so much Gothic picturesqueness abounds, would have to undergo a sort of mental revolution to become enamoured of the subtle refinements which characterise Greek curves. When the Renaissance was introduced into Spain the Gothic style was at its best. Seville Cathedral, which was to be unequalled for beauty, was commenced in the century previous, and several of the most remarkable buildings in the country belong to the fifteenth century. The Spanish architects of that time had also at their command the services of Flemish and Moorish craftsmen for the execution of surface decoration; and, in consequence, work of the utmost richness was produced. To eyes which had been accustomed to gaze on what had been done at Burgos, or Toledo, or Miraflores, the best reproduction of a Greek temple would be as chilling as the blasts from Guadarrama are said to be in the hottest days of July. The spirit of the age accordingly prevailed in the sixteenth century, as it has done since, and as it will ever do. The book of DIEGO DE SAGREDO, which was published in 1526, was a Spanish adaptation of VITRUVIUS, and contained plans of classical buildings. We may assume that it represented the advanced architectural desires of the time; but there is a vast difference between Vitruvian buildings and the earliest attempts of the Spanish Renaissance. The surface and other decoration which prevailed in Gothic buildings was not supplanted; on the contrary, it (under new forms) was applied even more liberally in the new Græco-Romano buildings. From the richness of the decoration the style is known as *La Arquitectura Plateresca*, or the style of the silversmiths, but the phrase should not be interpreted as being contemptuous. The Spanish Renaissance buildings until towards the close of the century are generally good in form; afterwards another mode, invented by CHURRIGUERA, became fashionable, and it was probably the most debased style that was ever seen in Christendom. To many architects Mr. SMITH's sketches will be acceptable, owing to the suggestions they supply for the application of ornament. The sixteenth-century buildings of Spain are characterised by great richness of ornamentation, and are accordingly expressive of a people who were wealthy, and any style for which popularity is desired in England must have the same quality. It will be well for us if our buildings will, with this richness, be as free from vulgarity as those which belonged to the Spanish grandees.

Mr. SMITH has derived his subjects from a rather wide region. As a matter of course he has visited Burgos, Toledo, Seville, and Granada; but he has also worked in Malaga, Saragossa, Cordova, Barcelona, Valladolid. A sketch has been also given of the palace in Madrid—for the purpose, we suppose, of serving as a foil to show the worth of the remainder. Finally, there are a few sketches from Tangier, which may suggest the influence of the Moorish element in works of another style. It will be seen from what we have said that the work of various provinces is represented in Mr. SMITH's plates. This is important, for Spain is a geographical expression rather than the name of a country having unity of race, and it is well to have opportunities to inquire how far local peculiarities of style asserted themselves.

The "Sketches" fitly open with the façade of the Hospital of the Holy Cross at Toledo, the portal of which is described by FORD as being one of the gems of the world. It is full of delicate carving, and the effect is heightened by the contrast with the plain masonry of the rest of the façade. The doorway has a semi-circular head, and around the moulding the arabesques are continued, running towards the middle in the

* *Sketches in Spain*. By Bernard Smith, Architect. Published by Bradley T. Batsford.

usual way. But the architect has not hesitated to place columns outside the arch, and to bend them to suit its contour as if they were stems of ornament. In another view is seen the Puerta del Sol Toledo, which is said to be the finest and most elaborate Moorish gateway in Spain; but the sketch does not suggest an imposing structure. The Patio, in the Hospital of Tavera at Toledo, shown on the same sheet, was considered by the late Sir DIGBY WYATT to be one of the most regular pieces of Italian architecture in Spain; and it is remarkable, as it depends for effect upon form rather than ornament. It has one Spanish peculiarity, which is seen in nearly all the sketches, and that is the absence of half balustrades at the ends of a bay. This may have arisen from the prevalence of iron balustrading in screens and other enclosures.

The Giralda Tower on the cathedral of Seville is a fine subject, in which Renaissance and Moorish details are combined so cleverly that there is no thought of incongruity. It was one of the first subjects selected by DAVID ROBERTS. In the Casa de Pilatos at Seville, which was supposed to be a copy of PILATE'S house in Jerusalem, Moorish and Gothic are mingled. An exterior view is given of the Seville town hall, which abounds in ornament, in pilasters, columns, friezes, doors, &c. The work is not all good, but we are told that "some of the undoubtedly unrestored portions are purer and more refined than those restored." The principal of the Malaga buildings shown in the sketches is the cathedral, which was never completed. It may be said to embody the different phases of Spanish Renaissance, and especially its decline. But the magnitude of the building—the tower is 300 feet high—makes it impressive in spite of its defects.

Among the sketches from Granada, Mr. SMITH gives some details of the Alhambra. It is satisfactory to know, on his authority, that the restoration of the building is being carried out "in a most conscientious and tender manner," by Señor CONTRERAS. We find also in the book some other interesting buildings from Granada, one being a house in the Carrera del Darro. As in so many others a great deal is made of heraldry. In a country where so much importance is attached to the *sangre azul*, it behoves every hidalgo to blazon his credentials to ancestry, and there seem to be as many shields in Spain as in all the rest of Europe together.

The buildings in Saragossa are of a more severe type than is found in other towns. Mr. SMITH says they are "almost insipid in their severity and plainness." The Exchange looks almost like an importation from Florence, but the interiors of the houses, as may be seen from the illustration we publish this week, are less peculiar. Of the ornamentation of buildings of this kind FORD says: "It must be confessed that these gay arabesques and warlike Roman decorations are better suited to the courtyards and banqueting-halls of chivalrous magnificence than to the cloister and refectory of the monk, or the altar and tomb of the Christian priest. The Cæsars, cupids, satyrs, tritons, and battle-axes mingle incongruously with the crows, ropes and racks of martyrs, with the crozier and cross, emblems of peace and religion."

The mosque or cathedral at Cordova would need as many plates as Mr. SMITH gives to all Spain to represent it properly. He gives but one sketch, which does not enable us to realise the effect of the multitudinous columns and mysterious vistas. Far better is the sketch of a preaching balcony on the south side of the exterior, although the cornice has a sort of cresting that is like modern cast ironwork of the commonest kind. From Burgos there are fine sketches of secular and ecclesiastical buildings, the most grandiose subject being the staircase in the north transept of the cathedral. Mr. STREET was of opinion that the cathedral was more French than Spanish; but such elaborate ornamentation as is seen in the sketch is rarely found north of the Pyrenees. Another departure from the rich type of Spanish buildings is seen in Valladolid, although they have not the severe appearance of those in Saragossa. In the museum there is a curious mixture of Gothic and Renaissance. A capital sketch of an angle window from a house in the town is given.

It will be inferred from what we have written that Mr. SMITH'S sketches are not of subjects which have become hackneyed, and in no case does he appear to have represented a building because it was curious or ancient or was of historical interest. His plates deserve to be called "eye-hints," and we are glad to have the opportunity of recommending a work which displays an earnest endeavour to produce something useful as well as beautiful.

PARIS NOTES.

THE section of painting at the Salon has completed its award of prizes by voting third-class medals to MM. Geoffroy, De Lalaing, Outin, Princeteau, Laynaud, Mercier, P. Robert, Berteaux, Burnand, Baillet, Marius Roy, Montenard, Le Senechal, Maincent, Daunal, Zacharie, Demarett, Jacomin, Armand Jean, Jenoudet, Pearce, Whistler, Bergh, Loewe-Marchand, Ch. Frère, Tavernier, and Larson. In sculpture, first-class medals were conferred on MM. Turcan, Carlier, Cordonnier, and Boisseau; second-class medals on MM. Etcheto Fagel, Vaureal, Desco, and Frère; and third-class medals on MM. Baffier, Germain, Penot, Lormier, Beguine, Marioton, Hainglaize, Hasselberg, and Briden. The only first-class medal given for gem-engraving was obtained by M. François, while M. Lamotte obtained a similar distinction for line-engraving, and M. Champollion for etching.

The two bas-reliefs entitled *The Triumph of the Republic* and *Mirabeau in the Tennis Court*, by M. Dalou, who gained the supreme reward of the Médaille d'Honneur in sculpture, have already been purchased by the State. These two works were executed in thirteen months, and the artist displayed rare perseverance on both of them, having, for instance, begun *de novo* several of the 58 figures contained in the former, and the same remark applying to many of the personages in the *Republic*. He fashioned everything with his own hands, even to the ornamental work, thus dispensing with the assistance of specialists; and it is stated that he devoted six weeks to the flags alone which appear in the bas-reliefs.

The following is a list of the sculptors who have obtained a Médaille d'Honneur at the Salon during the past seventeen years: 1865, M. Paul Dubois; 1868, M. Falquière; 1869, M. Perraud; 1870, M. Hiole; 1874, M. Mercie; 1875, M. Chapu; 1878, MM. Barras and Delaplanche; 1879, M. René de Saint-Marceaux; 1880, M. Gabriel Thomas; and 1881, M. André Allar. There was no medal awarded in 1866, three ballots having failed to give any definite result; in 1867 the medals were reserved for the Fine Arts Section of the Universal Exhibition; no Salon was held in 1871, and no medals awarded in 1872, 1873, and 1882.

Good prices were obtained for some of the pictures in Baron de Beurnonville's collection just sold at the Hôtel Drouot. Among others may be cited: *Portrait of Madame de Viette*, by Greuze, 10,100 frs.; *Portrait of a Girl*, by Louis Tocqué, 10,000 frs.; *The Enchanted Island*, by Watteau, 20,000 frs.; *The Water Mill*, by Hobbema, 28,000 frs.; *The Obelisk*, by Rembrandt, 10,000 frs.; *The Village on the Heights*, by Ruysdael, 17,800 frs.; *Peasants*, by Wouvermann, 10,700 frs.; *San Giorgio Maggiore*, by Guardi, 10,950 frs.; *Death of Hassan*, by E. Delacroix, 4,300 frs.; *Angelique*, by Ingres, 4,500 fr.; *Head of Young Girl*, by Jacquet, 2,500 frs.; *A Marsh in Burgundy*, by Th. Rousseau, 4,800 frs.; *Effect of Sunlight before a Storm*, by Troyon, 7,300 frs. The sale produced a total of 509,665 frs.

A sale of paintings and sketches given by various artists to the widow of the late Edmond Membrée was held last week, and realised upwards of 60,000 frs., a sum that bears eloquent testimony to the generosity of the artistic world, the contributors being by no means exclusively French, but including such foreign celebrities at Messrs. Nittis, Stevens, Heilbuth, &c. The highest prices realised were for a water-colour *Dorante*, by Meissonier, which fetched 7,005 frs.; a *Study*, in oils, by M. Bonnat, 7,000 frs.; and a *Flock of Sheep entering the Fold*, by M. Ch. Jacques, 4,300 frs.

It now appears certain that the struggle that has been going on for the past three months between the ultra-Radical and utilitarian majority of the Paris Municipal Council on the one hand, and the entire community of art and letters on the other, over the lately-discovered remains of the Arènes de Lucece, in the Rue Monge, has happily resulted in a victory for the latter. Last week the delegates of the Académie des Inscriptions et Belles-Lettres visited the spot, in company with the members of the Municipal Highway Commission, and since then negotiations have been opened between the State and the City of Paris, on the basis of the Department of Fine Arts and the City bearing half each of the cost of preserving these interesting relics. The plan adopted will probably be to clear away the rubbish and earth now encumbering the remains, and make a public square on the space thus cleared. The acquisition of this ground, amounting, as it does, to several thousand square mètres, must prove extremely

costly for the company that undertook the construction of the new street between the Rue de Linné and the Rue de Navarre across the site of the Arènes demands, 200 frs. per square mètre for the ground it will have to give up. There is little doubt, however, that an arrangement will be arrived at within the next few days, and the last vestiges of the old Lutetia thus preserved from the speculative builder.

The committee of inquiry into the present position of the art industries of France, and the workmen employed therein, continues its sittings under the presidency of M. Kaempfen, Director of Fine Arts. It has lately examined representatives, both of masters and men, from St. Quentin, Creil, Méru, St. Geneviève, Bordeaux, &c., and it is especially noteworthy that nearly all the witnesses call for the foundation of more schools of technical instruction and design, with the view of raising the artistic quality of the work, and so enabling French manufacturers to compete on more advantageous terms with their foreign rivals. The demand for increased facilities of technical education appears to be coming general in all industrial communities.

A serious strike appears imminent in the Paris building trade. It appears that many contractors have not conformed their rates of pay to the scale fixed by the City, and the men are therefore generally preparing to leave work. The Chambre Syndicate of house-painters has announced that measures are about to be taken to support the claims of its adherents; while the stone-carvers have gone still further, several firms, who on last pay-day did not conform to the City tariff, having been already placed on *the index*—i.e. no members of the union can accept work with them. Other trades unions are preparing to follow this example, and unless the firms in question give way, it is almost certain that a general strike will be declared just when the busiest part of the building season is commencing. The only parties who can gain by such an event are the Italian, Swiss, and German (so-called Alsatian) workmen, many of whom have of late years been attracted to Paris by the high rate of wages prevailing; and a strike on a large scale would inevitably bring into the City many more of this class of artisans.

The Municipal Committee presided over by M. Alphand, the Director of City Works, has drawn up the programme of the July 14 National Fête. The Trocadéro has been decided upon as the central point of this year's celebration. The palace will be decorated with 10,000 flags, illuminated *à giorno*, and all its outlines lit up by rows of gas jets. Facing it, a magnificent water fête is to be held on the Seine, the quays along the river being illuminated by means of strings of tri-coloured (red, white, and blue) gas globes set close together at distances of about only 18 inches. Prizes will be given to the best decorated, and illuminated shipping on the river, and the vast space of the Champ-de-Mars, exactly opposite the Trocadéro on the other side, will be given up to a grand display of fireworks, at which the public bodies of Paris and its neighbourhood will be invited by the Municipality to assist.

At the sale of M. Emile de Girardin's pictures, held last week, a small landscape was sold as one of Corot's; but M. Arsène Houssaye, the well-known novelist, has now come forward and informed the purchaser that the painting is one by himself, which he had given to M. de Girardin. It is difficult to understand how such a mistake could have occurred, as the picture was signed with a big H. A similar error was made at M. Paul de Saint-Victor's sale, the real author of the work, strange to say, being the same in both cases; but Mdlle. de Saint Victor bought back from the buyer the picture M. Arsène Houssaye had given to her father.

Pressure is being brought to bear on the Government in favour of either restoring the ruined Cour des Comptes, for the purpose of providing another and more suitable *local* for the Ministry of Finance, which is now a standing menace to the Louvre through the danger of fire, or to pull down the ruins and dispose of the site for building purposes.

The "Philadelphia Times" says that the daily consumption of bricks at the New Public Buildings in that city is now 20,000, but 50,000 could be used if they could be had. From the beginning of the work to the close of last year there has been used in the building nearly 1,000,000 cubic feet of foundation stone, over 200,000 cubic feet of New England granite, over 600,000 cubic feet of Lee marble, over 100,000 cubic feet of buff and blue Ohio sandstone, 2,400 tons of iron floors and roofs, over 1,000 tons of cast-iron fixtures, 405 tons of slate roof, and 57,215,608 bricks. Nine million dollars have been expended on it, and the final cost is estimated at 12,000,000 dollars, without fittings.

THE CLASSIC SCHOOL OF PAINTING.

THE "Classic School" formed the subject of Mr. Ruskin's third lecture at Oxford. Two different uses, he said, attached to the word "Classic." First, it might be used to cover all that was senatorial, academic, authoritative; but, secondly, and this was the sense in which he used the word, it meant anti-Gothic—contemptuous of the failures of Gothic, unforgiving to its faults, cold to its faith, and impatient of its absurdities. Mr. Ruskin claimed to be an admirer of both schools; but while he thought it quite right that the Elgin marbles should be given a place of honour in our national museum, he failed to discover why, to see any reminiscence of Chartres or Wells, one should be forced to go either to the miscellaneous muddle of South Kensington, where Gothic saints and sinners are confounded all alike with models of threshing machines, or to the Crystal Palace, where Gothic is made to keep company with Rimmel's perfumery. The history of the Classic school consisted in its gradually acquired skill in delineating the human body glorified by the arts of war; while the history of Gothic may be traced from the time when the northern builder smote the rocks which he had torn from among the moss of the moorland into the likeness of strange beasts and hobgoblins to the perfect art of Holbein, Sir Joshua, and Gainsborough. And the spirit of reconciliation between the two schools was given in the last recorded words of Gainsborough: "We are all going to heaven, and Vandyck is of the company." Herein, Mr. Ruskin said, was a maxim of the highest importance in comparing different schools of art; it is all a question, not of skill, but of tendency. Mr. Ruskin illustrated his argument by exhibiting in succession some initial letters from a MS. of the twelfth century, in which the design was chiefly of very strange-looking dogs, and an enlarged copy of a piece of Pompeian art, representing a sublimely classic cat catching a sublimely classic kitten. The dogs were hardly more skilfully done than the cat, but everyone could see in a moment that the art which could perpetrate the cat was in its decline, whilst the art of the painted missal was in its youth. The mention of the dog led Mr. Ruskin to remark incidentally that the nucleus of all that was best in the Academy was to be found in three pictures which hang side by side in Room 4—Mr. Briton Rivière's *Playfellows* (392), quite the most beautiful thing of the kind he ever saw, and Mr. P. R. Morris's two pictures of children (391 and 397).

Mr. Ruskin then reverted to his statement that for perfect examples of Gothic art may be taken the works of Reynolds and Gainsborough, and for typical pictures Sir Joshua's *Age of Innocence* and Mrs. Pelham, and Gainsborough's Mrs. Graham and Blue Boy. In these pictures the painters had spent much trouble on toilette—frillings and trimmings, cuffs and collarettes—a method of treatment which would hardly have commended itself to Zeuxis and Parrhasius. But the contrast may best be seen by remembering that while classic art would be well content to rest on its torso of Theseus, the Goth paints five little girls without even a torso at all. Gothic art is concerned with the head; classic with the body. Students should study both, but not the bones of one nor the skull of the other. In 1880 the Venetian Academy did him the honour to take down and place in a private room for him his favourite Carpaccio, *The Dream of St. Ursula*, and in the same room were some excellent casts from the *Ægina* marbles. He was able to enjoy the art both of the Goth and of the Greek with his whole heart, but the beauty of the *St. Ursula* was all in her head, that of the marbles in the elbows.

And in one respect Mr. Ruskin said he claimed Sir Frederick Leighton as a kindred Goth—namely, for his exquisite portraits of children. The classics are full of the wrath of Juno and the power of Minerva, but nowhere do they give us a picture of a goddess in girlhood; and Sir Frederick Leighton deserves extreme gratitude and unqualified admiration for descending from the majesty of Olympus to paint for us the witchcraft and wonder of childhood. His examples in this year's Academy could not, however, be regarded as satisfactory. The one called *Kittens* (330) was clearly hastily finished; the critics were forced to praise the child's dress, and not her face; and the kitten, he felt sure, was studied from a puppy. But, speaking generally, Mr. Ruskin could not praise too highly Sir Frederick Leighton's work of this kind, which only missed the level of Correggio by not being painted lightly or broadly enough. Of Sir Frederick's other work—in depicting the organism of the human body—Mr. Ruskin could speak of its consummate skill, but he did so without any sympathy. He preferred to dwell upon two little pencil drawings which Sir Frederick lent long ago to the Ruskin Drawing School—one of a lemon tree (reproduced in *The Architect*), the other of a Byzantine well in Venice—both entirely exemplary and without rival in delicacy of touch and precision. Mr. Ruskin's only wonder was that Sir Frederick had not continued his work in landscape; nothing could be more beautiful than his studies of light and colour in Italy and Greece.

In all great art the mystery of cloud is combined with the majesty of light; but in Mr. Alma Tadema, whose faithful rendering of marble and of leaves is above praise, everything is twilight. And in keeping with it, there is a universal tendency in all his figures to lolling attitudes of fear and laziness, until in the "Pyrrhic Dance" we seem to have a microscopic view of a

small detachment of black beetles in search of a dead rat. Classic art deals with the human body; yes, but glorified by the arts of war:—

You have the Pyrrhic dance as yet,
Where is the Pyrrhic phalanx gone?
Of two such lessons, why forget
The nobler and the manlier one?

Not (added Mr. Ruskin) that Mr. Alma Tadema is personally to blame; he only reflects the disfigurement and disgrace of the nineteenth century, with its vast vortex of revolutionary rage against priesthood and knighthood, and all else that resists the license of mankind. Hence it is that so many modern portraits seem to say—in pride, "Look how grand I am;" in immodesty, "See how handsome I am;" in idleness, "I keep any number of flunkies, and never did a stroke of work in my life."

The British public has been very fond of saying to itself these many years that "a thing of beauty is a joy for ever," although all the time it has been doing its best to banish beauty from the face of the earth. A beautiful thing may exist only for a moment as a reality, but as a testimony for ever, and it were truer to say "a thing of beauty is a law for ever." The beauty of Greece depended on the laws of Lycurgus, as the beauty of Rome on those of Numa; and on all beautiful features are written obedience to law and faithfulness of charity.

DORIC ARCHITECTURE.

THE subject of the second lecture on Greek art, which was delivered by Professor Mahaffy in Dublin on last Saturday, was Doric architecture. In his first lecture the Professor said he exhibited illustrations of remains of prehistoric architecture in Greece, and it was plain that, while differing from each other in many points of detail, the illustrations all had a strong family resemblance, and presented a remarkable similarity in style. How did these early specimens compare with the structures of the later—what was called the historical—period? Nothing could be more complete than the contrast between them. From the decorative and ornamental character of the pre-historic period we might expect that the historic style which followed it would have abounded in luxuriant ornament, but instead we found the Doric order calm, severe, sparing of ornament, and yet presenting the most perfect types of beauty and proportion. What was the explanation of this? The natural explanation under such circumstances, where one style did not appear *per se* to have been evolved from the other, was that it was due to some foreign intervention, and hence learned men, starting with the hypothesis that the Doric temple was imported by the Greeks from some other country, had concluded that Egypt was the birthplace of the historic style of Greek architecture, and as some of the Egyptian temples manifested features of resemblance to the ancient Doric remains, these were for a long time supposed to have been the models from which the early Greek architects had borrowed. The difficulty, however, of accepting this explanation lay in the fact that, up to a date much later than the origin of the historic temples, Egypt was closed to the Greeks. There was no satisfactory evidence that the Greek historic temple, any more than their other styles of architecture, had been borrowed from a foreign source. This hypothesis, therefore, failing, we were thrown back upon theory to account for the Doric temple. The theory which he (Professor Mahaffy) propounded some years ago, and which was very much criticised at the time in Germany, was that the Greek temple had its origin in a wooden building. This theory was supported by a curious passage in Pausanias, who, in his description of Olympia, mentions that he found a wooden pillar remaining in the ruins of a house of Olympia, and which, he says, was an object of interest and curiosity to travellers visiting the locality. The same historian also mentions that in the famous temple of Hera, at Olympia, one of the pillars was composed of oak. These passages in Pausanias naturally created much interest among scholars in connection with the excavations recently undertaken at Olympia, as it was hoped that even if portions of one of those ancient structures were discovered persons skilled in Classic architecture would be able to reconstruct the entire, and that light would thereby be thrown on Grecian history. The positions of the edifices were so accurately described by Pausanias that there was no difficulty in identifying the remains when discovered with the temples to which they belonged. The evidence of the German scholars who directed the explorations when they found the site of one of these ancient temples at Olympia was very curious and interesting. In the first place, whereas in exploring the ruins of other ancient edifices there were found, not only fragments of the pillars, but also of the cornice, architrave, and roof, it was remarked that in the case of the temple at Olympia not a vestige of any part of the roof was discovered. Secondly, they found the separation of the pillars so wide as to make it difficult to understand how stones could have been found sufficiently large to span the interval. Thirdly, it was ascertained that the remains of the pillars showed remarkable variations in style and outline. For instance, the fluting varied, some having sixteen and others as many as twenty in the circum-

ference of the shaft. The inference from these discoveries was plain. The roof had altogether disappeared, because being of wood, and not of stone, it had decayed. The wide spaces between the pillars pointed to wooden beams supporting the roof; and Pausanias's statement that one of the pillars at the time he wrote was composed of oak curiously harmonised with the fact that the stone pillars discovered among the ruins evidently belonged to different periods. As each of the original wooden pillars decayed it was replaced by one of stone formed after the fashion of the period in which it was built, just as some of our own Mediæval churches showed various styles of architecture, as when any portion of the edifice had required restoration the architect followed, not the style of the original building, but that of the period to which he himself belonged. Illustrations of the eleventh century were consequently mingled with more modern restorations in the styles of the twelfth, thirteenth, and fourteenth centuries. The same thing had been done in the early Greek temples. These discoveries at Olympia confirmed in a remarkable manner the theory that the original Greek temple was not of stone, but of wood, and that stone was gradually substituted for the more ancient wooden structure. Another discovery which surprised the explorers was that a large number of pieces of coloured terra-cotta were found amongst the ruins which were evidently used in covering portions of the temples. Subsequent researches led to the discovery of terra-cotta remains in many other places, and it was now believed that the Greek temples were originally made of wood, portions of which were covered with terra-cotta, both for ornament and to preserve them from the weather, and that subsequently, when wood gave place to stone, the former practice of covering with terra-cotta was still adhered to, for evidences of it were found among many of the ruins of the stone buildings of the Greeks.

Illustrations of Doric architecture were projected on the screen of the temple of Sagesta in Sicily, the temple of Ægina, the temple of Minerva at Sunium, and the Parthenon, which was described as being the most perfect model of architecture extant of any age or country. All these historic temples, the Professor said, were characterised by a certain sameness of style. The dimensions, the number of the columns, the height, the proportion of height to the width, might vary, but still they had all a certain family likeness, and no one could mistake a Doric temple when once he had seen it. Nothing appeared more simple, and so the builders of the Renaissance period thought when they began to imitate Greek temples. It seemed to them that all they had to do was to build upon straight lines in certain fixed and definite proportions, but, nevertheless, it was found that none of the imitations looked like the originals. Copy as they might, there was still something about the old structure which the imitators could not match. What was the secret? It was reserved for the genius and industry of future ages to find the explanation. In the first place it was found that the Doric pillar, instead of being of same diameter along its entire height, tapered gradually and very slightly towards the summit. At one time it was imagined that the shaft swelled slightly about the middle. This, however, was found to be an optical illusion; but there was no doubt, for actual measurement demonstrated, that the Doric column became very slightly thinner and more taper towards the summit. The object of this was obviously an optical one. If a pillar were formed of perfectly straight lines, with the same dimensions along the entire height of the shaft, it would to the eye, by a curious optical effect, actually seem broader at the top. Hence, to obviate this illusion, the Doric architects tapered the shafts of their columns. The result of modern research had been to show that the lines and proportions of Grecian architecture were all designed with a view to optical illusion; and for the same reason in parallel rows of pillars, actual measurement showed that the shafts were not exactly upright, but very slightly inclined inwards, so that the lines of each opposite pair of columns would meet if produced to a point about 5,000 or 6,000 feet in vertical height, as was shown by the measurements taken from the Parthenon. These facts were not new—they were known long since; but they did not give the whole explanation of the difficulty. The main secret was brought to light in 1843 by the investigations of Mr. Penrose, who was sent on an expedition to Athens by the Dilettanti Society, a private society of noblemen and gentlemen, who had done more than any other body in modern times for the encouragement of classical research. Arriving at Athens, Mr. Penrose visited some of the finest remains of Grecian architecture, especially the Parthenon and Theseum, every detail of which he measured with the most scrupulous care and accuracy, and gave the world the result of his investigations in a splendid volume entitled the "Principles of Athenian Architecture," which embodied the greatest discovery that had been made on the subject in modern times. With true modesty, Mr. Penrose disclaimed originality, and affirmed that he had only rediscovered the facts which his book contained, pointing especially to a passage in Vitruvius, in which the principle was obscurely hinted at; but unquestionably the credit was due to Mr. Penrose of having made the discovery that the lines on which the Greek temple was constructed were not straight, but curved. Slight, delicate, and almost imperceptible, the lines of these great classic structures were in no part straight; all were curves. The floors, instead of being perfectly level, were very slightly curved upwards towards the centre.

The architraves, the lines supporting the roof, the lines of the pillars, and every part of the edifice were constructed not on straight lines, but on curves; and it was remarkable that the curvatures were not exactly uniform, but varied not only in different temples, but even in different portions of the same structure. This curious arrangement could not have been done by chance; it must have been the result of design. Unfortunately, the great work said to have been written by the architect of the Parthenon was lost; but there was every reason to suppose that this arrangement of curves was designed with a view to optical effect, for it was remarkable that it was adopted only in the larger temples, and that in the smaller edifices it was not resorted to. Thus in the temple of Nike it was not seen, not being requisite except in structures of large proportions. This delicate and beautiful arrangement of curves did not—it was not likely that it should—outlast the early age of historic architecture. The principles on which it was founded were not understood by later architects, and the consummate art with which the curves were constructed was lost, and thus the later styles—Ionic and Corinthian—though graceful, elegant, and ornamental, were wanting in that calm and severe beauty of form and proportion which must for ever characterise the Doric to all future eyes as the highest perfection of architecture attainable by human genius.

DOMESTIC ARCHITECTURE OF INDIA.

A PAPER entitled "Some Notes on the Domestic Architecture of India" was read at a meeting of the Society of Arts on May 23 by Mr. C. Purdon Clarke. He said that as the paper referred only to domestic architecture, represented by existing buildings in India, he should not discuss the question whether there existed in the country a widespread, indigenous, and national style. Fifty years ago attention was directed to the "Shilpa Shastres," and Ram Raz, a most able native scholar, undertook their investigation; but he died before the completion of the work, and this mine of technical information had remained unexplored. His treatise, published in 1834 by the Royal Asiatic Society, made the date of these books contemporaneous with the decline of Buddhism. As Ram Raz showed that minute directions are given in the "Shilpa Shastres," from the choice of a site to the final embellishment with bright colours, even to the house-warming, it would be assumed that, wherever Hindoos built, one style must be found. They doubtless did their best to follow its directions, but in practice local influences and traditions, the requirements of the climate, the plenty or scarcity of certain building materials, all played their part in producing local peculiarities which, in some cases, had developed into apparently distinct styles. These and the modifications of the ingrafted arts of alien conquerors were scientifically examined, grouped, and described by James Ferguson, who, while preparing his universal illustrated "Handbook of Architecture," published in 1855, succeeded in reducing this chaos to rule and order. Almost every style in the history of art might be found, Indianised, either in existing buildings or ancient ruins. Assyrian, Burmese, and Chinese influence could be traced in the Hindoo ornamentation of Southern India; the different varieties of Saracenic, all more or less Indianised, in the Mogul art of Sindh, the Punjab, and Bengal; Moorish forms appeared in the Deccan. A debased Greek treatment, strangely Byzantine in expression, marked the ancient ruins of the Afghan frontier and some temples in Cashmir. Gothic and Renaissance forms were also represented in places where the Portuguese ruled; and, lastly, an English pseudo-classical style, bald and hideous beyond description, introduced by our own people in the last century, still remained, for police-stations and kindred constructions, the official style of the Indian Public Works Department. The Mahratta States round Bombay although exposed to wave after wave of alien influence, possessed an art of strong character, which, if not indigenous, was, at least, of respectable antiquity. There was a strong family likeness between the intramural houses of the cities of Bombay, Surat, Broach, and Ahmedabad. In each, narrow frontages marked the business centres; but in the maze of crooked streets behind the great bazaars were found spacious façades which would be considered worthy of place in any of the great streets of Europe. Going, then, with some detail into the arrangement and dimensions of houses of different types, the lecturer illustrated his remarks by reference to a large collection of photographs of houses, of which the elaborate and striking ornamentation excited much comment; to sketches by Mr. Kipling, and to drawings of which some had been made by students of the Bombay and Lahore Schools of Art. Having described two styles, Mr. Clarke said that every great division of India could contribute something to our store of information, and if as much were done to investigate and preserve the living traditions of Indian handicraft as was now devoted to the more speculative work of archæological research, we should be soon in possession of the key to much puzzling matter, both in the arts, social relations, and politics of the people of India. Sir George Birdwood, who presided, said that what most impressed him was the obvious similarity of the ground plan of the houses described by the lecturer in Greek and

Roman houses, which was to be accounted for partly by the fact that the Greeks and Romans were offshoots of the same primitive Aryan race as the Vedic Hindoos.

THE SANITARY CONGRESS IN GLASGOW.

A MEETING has been held in the Council Chamber, Glasgow, to explain the arrangements in connection with the forthcoming Congress of the Sanitary Institute of Great Britain. The Lord Provost presided.

Mr. Henry Johnston, one of the hon. secretaries, submitted the report of the executive committee. The president has not yet been chosen, but the following vice-presidents have been selected:—*Sanitary and Preventive Science*—president, Professor W. T. Gairdner. *Engineering and Architecture*—Professor Thos. R. Smith. *Chemistry, Meteorology, and Geology*—Dr. R. Angus Smith. The Congress will open on Tuesday, September 25, and will terminate on Saturday, September 29. The meetings of the sections will be held in the Philosophical Institution Rooms, Bath Street. A public luncheon will be given to the Institute in St. Andrew's Halls at 1 p.m. on the day of opening the Congress. On the following day the Lord Provost and magistrates will give a grand reception conversation to members of the Institute in the Corporation Galleries, Sauchiehall Street. On Friday, the 28th, the closing general meeting of the Congress will take place in the Philosophical Rooms at 5 p.m., and on the same evening a public dinner will be provided in the St. Andrew's Halls at 7 p.m. Saturday, September 29, will be devoted to excursions and to visiting public works and places of interest in and around the city. It is expected that during the week of the Congress a popular address by Dr. Carpenter on some important sanitary subject will be delivered to the working classes. The committee have further to report that arrangements are in progress for holding a sanitary exhibition in Burnbank Drill Hall, Great Western Road. This exhibition, which will consist of articles and appliances illustrative of the latest advances in sanitary science, will be opened by the Lord Provost on Tuesday, September 25, and will remain open till the evening of Saturday, October 20. Regulations for exhibitors, and full particulars regarding the exhibition, will shortly be published. Meantime the committee require funds to aid them in carrying out the arrangements. The expenses of the Congress are estimated by the Finance Committee at from 1,200*l.* to 1,500*l.*, and have to be met by the local committee. While it is the desire of the committee to raise a sum of not less than 1,500*l.*, should the expenses of the Congress be less than the sum estimated, a *pro rata* return will be made to the subscribers to the extent of the balance remaining. In moving the adoption of the report, the Lord Provost thought he was warranted in anticipating that the Congress would be a successful one. Doubtless they would get from the eminent men connected with sanitary science then in Glasgow a large amount of fresh information. The city had, he was sorry to confess, of late weeks had a high death-rate, which had been mainly attributable to preventible diseases; and those who were bringing to the city men with better information on sanitary matters were doing their fellow-citizens a great service. For his own part, he should count any money well spent that assisted in such a good object. The public lecture would, he was happy to say, be given by a very popular man—Dr. Carpenter—who had for many years led the van of scientific progress. Mr. J. McLaren, President of the Chamber of Commerce, seconded the motion, which was adopted unanimously. On the motion of Professor Gairdner, seconded by Lord Dean of Guild Stephen, it was also unanimously agreed to raise such a fund as was mentioned. It was intimated by Mr. J. Nicol, the City Chamberlain, that 470*l.* had been already subscribed. The usual votes of thanks closed the proceedings.

THE BLENHEIM COLLECTION OF LIMOGES ENAMELS.

THE Duke of Marlborough has, according to the *Times*, decided that the Blenheim collection of Limoges enamels is to share the fate of the Sunderland Library. On June 14 it will be sold by Messrs. Christie, and another of the glories of Blenheim Palace will be gone. It is well to take these things philosophically, and to admit that there are advantages as well as disadvantages in the breaking-up of great historical collections. Blenheim will be the less worth seeing after its enamels are gone, as it is the less worth seeing now that the shelves in the great library are bare; but other houses will be all the better furnished, and the interest in the great enamellers of the Renaissance will be more widely spread.

The history of Limoges enamels, which for centuries had seemed lost, has in our own day received the attention that it deserved at the hands of M. Darcel, M. de Laborde, and many other French students, the results of whose inquiries have been embodied in more than one English book, notably in Mrs. Pattison's

excellent work, "The Renaissance of Art in France." There is not, indeed, much information of a very definite kind to be gained about the early enamels, such as the splendid archaic crosses and the like which are one of the chief attractions of the Hôtel Cluny. We know that enamel-work in the Middle Ages went hand in hand with glass-painting; we hear of a great school of enamellers at Cologne so early as the ninth century, showing the influence of Byzantium; and we can trace the art at Limoges itself back to the twelfth century. The sack of the city by the Black Prince in 1370 seems to have ruined the industry, which was long in reviving. But under Francis I., when internal tendencies and external teaching combined to bring about that new birth of art which we call the Renaissance, the enamellers of Limoges began once more to take a place among the artists of their country, and very soon both reached a perfection unknown before and secured a popularity never enjoyed till then. In former days they had worked for the churches; now, with the new taste for beauty and pleasure, with the spread of wealth and culture, with the improvements in the construction and furniture of houses, a demand arose for enamels to decorate the buffets and the walls of dwelling rooms. Most of the fine pieces now in the great public and private collections—in the Louvre, the Musée Cluny, the South Kensington Museum, in the collections of Lord Warwick, Sir Richard Wallace, and others—were made for this sort of decoration; or, like the dishes, salt-cellars, and sets of plates which are not uncommon, for combined decoration and use. So considerable was the demand that a long list of artists, on whose history much light has lately been thrown, worked at the art during the whole of the sixteenth century, and handed on the torch, though with a flickering flame, to others almost as industrious if not so great as themselves. Everyone who has studied the treasures in the Salle d'Apollon with any attention will remember the names of the Penicaud family, of the Courtois or Courteys family, of Suzanne de Court, of Pierre Reymond, and above all of Leonard Limousin—Leonardus Lemovicus—*peintre du Roy*. A century afterwards we find various members of the Laudin family carrying on the work, and of course reflecting, in their tasteless subjects and in their coarse execution, the debased art of their day.

Mr. A. W. Franks divides the painted enamels of Limoges into four classes: (1) Early or Gothic style, from about 1475 to 1530; (2) Fine style, from about 1530 to 1580; (3) Minute style, to about 1630; (4) Decadence to the termination of the manufacture in the eighteenth century. In the first period the enamels were generally executed on short plates of copper nearly flat. The back was coated with a thick and opaque layer of enamel, to prevent the metal from warping in passing through the furnace. The front, or surface to be painted, was covered with brown enamel, and the details of all kinds painted on in opaque white. Such portions as were to appear coloured were then glazed over with transparent enamel, and the lights and details were picked out with gold. To increase the rich effect of the painting, small raised discs of gold called *paillettes* were attached to the enamel and covered with colour, so as to have the appearance of gems. The tints to these early enamels were very varied and exceedingly vivid, so as to produce the effect of illuminations. The principal enamellers of this period were Nardon, or Leonard Penicaud and Jean Penicaud. Owing to the great influence of the Italian artists who formed the school of Fontainebleau, a great and rapid change took place in French art in the early part of the sixteenth century. The enamel painters were not behind the others, and they sought to improve their designs, and adopted a more sober and harmonious system of colouring. Many of the most successful enamels are merely painted in *chiaroscuro*, with light flesh tints, and occasionally a cool tone on the foreground. The use of *paillettes* was abandoned, the plates were made thinner and consequently more convex, and the enamel at the back nearly transparent. Great use was made of the designs of Raphael, which were rendered available by the engravings of Marc Antonio and his followers. The family of Penicaud still continued their labours, but the greatest of the artists of the period was unquestionably Leonard Limousin. Pierre Reymond commenced enamelling nearly as early, and Jean Court and three members of the Courtois family excelled chiefly in the production of enamelled services for the table. Jean Courtois, by the profuse use of foil and the over-richness of his colouring, prepared the way for several enamellers, probably his pupils, who appeared towards the close of the sixteenth century. The principal of these is Suzanne Court. In the fourth period the enamellers were numerous, but chiefly of the families of Laudin and Nouailher. Of these Jacques Laudin produced some *grisaille* paintings of merit, rendered attractive by the fine glossy black ground which he employed.

The Blenheim collection consists of some eighty pieces, of varying merit and importance, but many of them noble examples of the best period and the greatest artists. There appears to be but one early specimen, the small enamel numbered 21, which represents the *Adoration of the Magi*, the style recalling the Flemish designs of Roger van der Weyden, or the work of the early Cologne masters. At the other end of the scale are a set of the *Twelve Apostles*, in the late Italian manner, and signed by one of the Laudins. But most of the pieces bear the precious

signatures "S. C." (Suzanne de Court), "P. R." (Pierre Reymond), "J. C." (Jean Courtois), and others of the great age. The simplest way to divide Limoges enamels is into those done in *grisaille* and those done in colours; and of both these kinds there are many fine specimens. First among the former we may mention the two large oval dishes (Nos. 61, 62), each 20 inches long by 15 inches wide, of which one was figured in the catalogue of the Loan Exhibition at South Kensington in 1874. This is a glorious example of the work of Jean Courtois, representing the *Vision of the Apocalypse*, the companion being an effective but ill-drawn work of Pierre Reymond, *The Battle of Four Kings against Five*. The smaller circular dish (60), also by Pierre Reymond; a beautiful tazza (55), painted after Raphael's design for the *Marriage of Cupid and Psyche*; a set of four figures of Virtues, signed "Ja. Penicaud, junior"; a set of ten plates, with emblems of the months, &c.; and, above all, a set of four superb hexagonal salt-cellars (48-51), are among the most notable pieces that remain.

Of the examples in translucent, as distinguished from opaque, enamel, the most brilliant are two plates (46, 47) representing scenes from the story of Joseph; a square plaque of the Crucifixion (58); a figure of a warrior (59); and an ewer (64). There are many more, but these are the finest, being, indeed, of a brilliancy which beggars description. Nothing can surpass the splendour of Joseph's coat—not "of many colours," but of blue heightened with gold—in the scene where he is interpreting the dream of Pharaoh, or the harmonious magnificence of the companion plate. The *Crucifixion* is the only work in the collection which bears the great name of Leonard Limousin; and it is, in colour, composition, and variety, worthy of that distinguished artist. The warrior on horseback is supposed to be Alexander the Great; his figure is finely drawn, and the colour is most brilliant, while the horse, in his odd, stiff attitude, is a curious example of the ultra-classicism of the time. The ewer is almost a repetition of one belonging to Lord Warwick (No. 744 in the South Kensington Catalogue); it is a magnificent example of Suzanne de Court's handiwork. Above is the *Triumph of Ceres*; a musician goes before her, and her car, drawn by cranes, is surrounded by joyous husbandmen. Below, suggesting with curious vividness the jumble of associations in which the artists of the Renaissance seemed to rejoice, we have *Moses Striking the Rock*, and the whole design is bordered with green leaves, masks, and jewels—as though Suzanne had resolved to crowd into one single surface all that she could imagine of richness, brilliancy, and delight.

It was shown at the Hamilton Palace sale last year that Limoges enamels had more than shared in the general rise of prices which all fine and rare works of art have latterly undergone. It may be expected that the sums paid for the finer pieces in the Blenheim collection will be quite equal to those given last year, and will make the prices of the Salamanca collection, and others of a few years back, appear quite insignificant.

MANCHESTER CATHEDRAL.

A MEETING was held in Manchester on Monday for the purpose of authorising the churchwardens to apply for a faculty to enable them to remove the north gallery in the cathedral, and make other alterations. The report from Mr. Crowther, architect, was read, in which he stated that an "examination was made into the condition of the floor framings, when it was found that the principals originally framed with timber, too slight for their bearings, and for the weight they had to carry when the gallery was filled with people, had, in consequence of their insufficient strength, and from having been constructed with unseasoned timber, deflected so seriously from a straight line as to disrupt the joints of the framing, and in some cases the tenons had no hold in the mortises. The principals were at once supported in the centre by wooden props, so as to render the gallery, as it was then supposed, temporarily safe, so far as such expedients can give security. But the whole structure is so inherently weak, and so badly framed together even with these supports, that I feel bound to say it is in the most unsatisfactory condition, and that a heavy responsibility will attach to the authorities if it be not at once taken down. But independently of the state of the structure of the gallery, the restoration of the pier arches of the north aisle, which will shortly be commenced, will involve the taking down of the gallery, as it would not be practicable to carry on the works connected with the restoration of this portion of the fabric of the cathedral without the removal of the gallery whilst they are in progress."

After hearing the report the requisite authority was given by the ratepayers. The chairman, at the conclusion, said the churchwardens had a very difficult task to perform just now in consequence of the state of transition in which the cathedral was; and they appealed to the seatholders to be as lenient as they could with the churchwardens till the restoration work, which he believed would be to the satisfaction of all the citizens of Manchester, was finished.

The Spring Exhibition of Paintings of the Royal Society of Artists, Birmingham, closes to-day (Saturday).

NOTES AND COMMENTS.

THE report on the Prevention of Fires in Theatres, which was presented at the meeting of the Society of Arts on Thursday, contained suggestions on the construction of theatres, which, however familiar, have yet to be accepted by managers. It was recommended that the building should be divided as much as possible by fireproof partitions, with a division between the stage and the auditorium, extending from the base to the roof. As regards the protection of the opening from the stage, there is some uncertainty. A fireproof iron curtain is supposed to be efficacious; but, in Berlin, such a curtain tore down part of the wall during the fire. In respect to water supply, the report gives preference to the mains in the street rather than to reservoirs at sufficient height. In America it has been found practicable to deluge a warehouse by a shower of water from fixed perforated pipes, but there is no information as to whether the arrangement would answer for theatres. It is recommended that means should be provided for carrying off smoke and heated air in case of a fire breaking out on the stage or amidst the scenery, instead of being drawn into the body of the theatre. The separation of theatres from adjoining buildings is said to be desirable, and it is of the greatest consequence to have exits into more than one or two streets. The exits should lead direct into the street, be of increased width outwards, and be free from obstructions. The doors should open outwards, and the staircases be provided on both sides with handrails.

AN appendix to the report contains the results of some investigations by Sir FREDERICK ABEL, the chemist, to discover a material for rendering wood unflammable. A coating of silicate of soda was found to have many advantages: its application is easy, and the coating is not deliquescent. A comparison was made by firing a hut, of which one part was coated with silicate of soda, and another part with a mixture of lime and alum, which is supposed by some to be efficacious, but it was found that the silicate was superior. Where it had been applied the fire did not completely penetrate the boards. When lime is combined with silicate of soda, the mixture resists the action of water as well as fire, and it is moreover a better protective against fire than silicate alone. Another mixture which Sir FREDERICK ABEL recommends for coating the interior of buildings consists of the following materials: (a) Equal parts of whiting and zinc (by weight), mixed and ground together; (b) equal parts (by measure) of water and syrupy silicate of soda; (c) the mixed liquid to be stirred up with the whiting and zinc, and then applied like ordinary paint.

THE late Rev. ARTHUR RIGG was a teacher of mechanical science who was able to combine theory and practice. His public lectures were always interesting, and were generally attended by the more studious workmen of the district. In addition, he was the teacher at Chester of many mechanical engineers whose names have often appeared in the patent lists. A few of his pupils resolved that there should be some memorial of Mr. RIGG, and the most suitable was considered to be a marble medallion, to be placed in the College Chapel at Chester. The commission was accepted by Mr. J. S. WEST-MACOTT, and the medallion has been completed. The white marble in which the head is carved is enclosed in a rectangular frame of grey Italian marble.

It is estimated that the value of the glass imported into India every year is about 400,000*l*. Still more remarkable is the fact that the greater part of it is supplied by Belgium. If the Belgian glass merchants took greater care in packing and avoidance of transshipments, it is believed that they would overcome all English competition in the East. Window-glass is principally used in India for making lanterns and mirrors. The Belgians are working hard to secure foreign markets. The new quays in Antwerp, which will be completed in 1884 by MM. HERSANT and COUVREUX, the contractors, will cost the State 2,800,000*l*. Vessels of 4,000 tons burden can now approach the quays. Down to the end of 1881 the enormous sum of 6,496,955*l*. has been expended on the improvement of the port of Antwerp.

FRENCH engineers are at present busy in Greece. A staff has been engaged by the Government for road-making, construction of harbours, and other engineering works. Railways

are in progress from Athens to Patras, from Volo to Larissa, and from Laurium to Athens. A concession for a railway from Athens to Larissa, to be prolonged probably to Salonica, will be shortly given, and other Thessalian lines constructed. A French company is draining the Lake of Kopais. Another French company is engaged in piercing the isthmus of Corinth, and one is actively mining at Laurium. The Paros marble is being worked more seriously. Not much English capital seems yet to have been attracted to these enterprises.

SCIENTIFIC principles are displayed in very trifling things, and therefore HERSHEY says that the production of a soap-bubble should not be deemed unworthy of the attention of the ablest physicists. We are not then to be surprised when it is found that a Senior Wrangler has devoted his leisure to the inventing of a window-fastener. Mr. SPRAGUE, of Edinburgh, has been able to utilise his Cambridge science in a thing that at first sight appears so commonplace, as well as in the verification of complicated assurance computations. The window-fastener which he has patented is without the springs and other complications that are generally supposed to be indispensable for such an article. It depends mainly on the action of gravity. By means of a semicircular cam, which hangs so evenly that it falls into a cavity whenever the sash is lowered, the window is made secure against burglars acting from without, and, as the fastener is self-acting, it is no longer necessary to depend on the care of servants. The principle of the fastener is so simple, it seems incredible that it has not been applied to use at an earlier date.

IT is not a difficult task to produce a picture of sheep in Canterbury meadows, or the like, which will pass for a "SIDNEY COOPER." But, however easy, there is risk in the work. The law is not above protecting Mr. COOPER's pictures, as an auctioneer has just discovered. He informed a solicitor privately that he was about to sell a valuable picture by Mr. SIDNEY COOPER, R.A., and the solicitor, with an eye to profit by a resale, attended the auction and boldly bid 104*l*. for the work, which of course was accepted. But when the picture appeared in a second auction-room, with better light, it was discovered that under the artist's name was the word "after." That word diminished the value of the work to 10*l*. The solicitor was not likely to lose his 94*l*., and accordingly brought an action against the auctioneer. The defendant pleaded that he was only the agent, and had paid over the sum received, less his commission. But the jury considered that he had acted as principal, and a verdict for 94*l*. was given. Henceforth auctioneers will need more caution when giving friendly advice about contingent bargains.

A PAPER which was read by Dr. SAMUELSON at a meeting in Manchester on Wednesday, explains how much has yet to be done to provide suitable dwellings for the humbler classes of workers in that city. It is assumed that 100,000 of the inhabitants are dwelling in damp and unhealthy houses, and there are in the city 11,000 back-to-back houses of two rooms, and which are without yards. In the outlying districts, where much building has been done, many of the cottages are said to be permanently damp and pervious to every storm. And yet, as Dr. SAMUELSON pointed out, for the last fifteen years the Manchester Society of Architects have urged upon the Council the necessity for consolidating and amending their building regulations. To this hour their prayer, although its appositeness was never called in question, continues to be disregarded.

MR. WILLIAM WHITE, F.S.A., has issued an appeal for aid towards establishing in London residential clubs or boarding-houses for students, clerks, and other young men of the educated class. It is believed that these institutions would be self-supporting, after paying a moderate, limited rate of interest upon the shares, which would represent the amount invested in procuring the requisite accommodation. This should provide, in addition to sleeping apartments, a dining and a reading room, a common room, gymnasium, and swimming bath. The benefits of such institutions are many and obvious; but as there appears to be a doubt as to the extent to which they would be taken advantage of, it will materially assist those engaged in considering the subject if an expression of opinion can be obtained from those likely to use them. Mr. WHITE accordingly asks also for information from those whom the proposed institution would benefit.

SKETCHES FROM SPAIN:—(1) DETAIL OF ARCADE IN PATIO, CASA DE LA INFANTA, SARAGOSSA. (2) CASA DE MIRANDA, BURGOS.

WE publish this week two plates from Mr. BERNARD SMITH's *Sketches in Spain*. One is of the first-floor arcade in the Patio of the Casa de la Infanta at Saragossa. Mr. SMITH, in describing the subject, says:—

"The variety and beauty of the detail is most remarkable, and the artist-carver who executed the work must have had, to alter a well worn quotation, an infinite fancy and most exquisite taste. The panels in the first-floor parapet are mostly filled with medallions, containing portraits of celebrities in sixteenth-century costume, carved in very high relief, and in a most masterly manner. There is a strong cinque cento feeling in some of the carving and detail, altered to suit the contemporary Spanish manner, but not so completely but that we can trace its origin. The work up to the first string above the arcade is all in stone. The elaborately-carved and panelled cornice is in wood, still in a state of good preservation, though it has been exposed to every variety of weather for over three hundred years."

The second plate is a view in the Patio of the Casa de Miranda at Burgos, built towards the end of the sixteenth century, and formerly the Palace of the Lunegas, the Condes de Miranda. Mr. SMITH's description is as follows:—

"The patio is unusually large, and a double square in plan. The detail throughout is of a plainer and more sober character than that to which architects at that period generally restrained themselves. The bracket capitals, which seem so appropriate in trabeated construction, and where, as in this case, the intercolumniation is necessarily wide, are here used everywhere. This detail of construction, which may be seen in almost every colonnaded patio in Spain of the sixteenth or seventeenth century, is hardly ever met with in France or Italy in buildings of the same period. The most beautiful example of bracket capitals is the well-known one in the patio of the Archbishop's palace at Alcala de Honares."

PROPOSED METEOROLOGICAL OBSERVATORY TOWER, SHIRE-
NEWTON, NEAR CHEPSTOW.

IT is intended by Mr. E. J. LOWE, F.R.S., late of High-field Observatory, Nottingham, to establish an observatory on his estate at Shirenewton, near Chepstow. The position is one of the best for the purpose in the West of England, and from it an uninterrupted view of the shores of the Bristol Channel and the Severn, from Cheltenham over Gloucestershire, Somersetshire, and Devonshire to Ilfracombe, can be obtained on the one hand, and from the Wyndcliff to Penarth Head and Brakesea Point on the other. It has been officially inspected by Mr. ROBERT H. SCOTT, Secretary of the Meteorological Council of H.M. Government, who states: "I have no hesitation in saying that for the purpose of meteorological observations, it offers very great advantages. The exposure to wind is very open in all directions, and if a well-equipped meteorological station were established here, the science would gain greatly." It is contemplated to make this a chief station, and to establish branch observatories at Swansea, Cardiff, Portishead, Clifton, and Gloucester. Amongst the trustees are the Duke of BEAUFORT, the Marquess of BUTE, the Earl of CORK and ORRERY, the Earl of DUCIE, Lord TREDEGAR, Sir JOHN LUBBOCK, Bart., M.P., Sir SAMUEL MARLING, Bart., Sir JOHN MACLEAN, Mr. S. MORLEY, M.P., &c. In describing the tower Mr. LOWE says:—

"In connection with the observatory, it is intended that a memorial tower shall be erected (designed by Mr. EDWIN SEWARD, A.R.I.B.A., architect, Cardiff), to be called the Albert Tower in honour of the late Prince Consort, who, more than thirty years ago, subscribed 105*l.* towards a similar institution which Mr. LOWE intended to establish. It was only when it was found impossible at that time to establish such an observatory that the Prince would consent to the return of his subscription. On again proposing a similar observatory under more advantageous circumstances, Mr. LOWE desires that a tower so constructed as to be a valuable addition to the institution should mark his appreciation of one who was ever a true friend to science and mankind."

The tower will be about eighty feet in height, and will be divided into stages for the work of making and recording observations. It will have a flat roof with a parapet, from which

signalling operations may be carried on in connection with distant stations. On the exterior the arms of the Prince Consort will be placed over the doorway, and those of the trustees, &c., in a frieze encircling the face of the tower. The arms of the founder will be carved on one of the angle buttresses. The turret will be fitted up with an anemometer and vane indicating force and direction of wind-pressure, and a pendulum of great length is to be constructed to register earth-trembling and earthquakes.

HAWTHORNDENE, BECKENHAM, KENT.

THIS house, now in course of erection for Mr. REST. FENNER, is situated in the Southend Road. The house is built of red bricks, with 1½-foot cavity filled with asphalt to form a vertical damp course. The stone dressings are of red Corsehill stone. The roof is covered with Broseley tiles. The floors of hall, dining-room, drawing-room, and study are formed with oak parquet.

The building is being carried out by Messrs. HOWARD & DORRELL, of Russell Street, Covent Garden, the contract price being 4,300*l.*

The architect is Mr. HERBERT D. APPLETON, A.R.I.B.A., of 157 Wool Exchange, Coleman Street.

The original drawing is now in the Academy, No. 1,233.

BUCKLAND CORNER, SURREY.

THIS country residence, which occupies a very picturesque site between Reigate and Dorking, with magnificent views of Surrey scenery, is now almost completed. The walls (with some slight exceptions, where stone has been used) are of red brick, the upper part being weathertiled, half-timber work being sparingly introduced. The roofs are covered with Exley's tiles. The parquet flooring will be supplied by Messrs. HOWARDS; the stained glass by Messrs. COX & BOURNE, of Birmingham; the joinery work by Messrs. SMITH & SONS, of Norwood. The chimney-pieces and other internal fittings have been specially designed by the architects, Messrs. CLAYTON & BLACK, of North Street, Brighton.

DESIGN FOR AN ARCHITECTURAL MUSEUM.

IT was proposed in arranging the plan that the building should be divided into two sections, separated by the tower and entrance hall; one half being intended to contain specimens of Gothic architecture, and the other for Romanesque. The museum would be entered by the tower, which leads to the hall and main staircase and galleries, the curator's room being situated at the back. The ground-floor would be occupied by casts of crosses and other large objects, the upper parts of which could be examined from the galleries. There are two tiers of galleries, approached by main staircase, and also by staircases in front turrets, the lower one to contain small casts. The spaces between windows would be utilised for hanging specimens of ironwork, &c., upon; the upper would be appropriated for exhibiting architectural drawings displayed on screens. Rooms for the attendants are provided over the curator's room.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

AN ordinary meeting of the Institute was held on Monday evening, Mr. Horace Jones, president, in the chair.

The decease was announced of Dr. Christian Hansen, of the Royal Academy of Fine Arts, Copenhagen, in his eightieth year. He was elected honorary and corresponding member in 1850, and was elder brother to Ritter von Hansen, who was elected in 1882.

The decease was also announced of Mr. James Thomson, who, it was stated, was one of the earliest members of the Institute. He was the son of Mr. David Thomson, of Melrose, and had been articulated to Mr. J. B. Papworth.

Mr. WYATT PAPWORTH, speaking of the late Mr. Thomson, said that gentleman had been the last of his father's pupils living. Mr. Thomson had been one of the originators of the Institute, which had been projected by a band of young men. Not before they had got it into some sort of working order did they avail themselves of the assistance of their elders to come before the world.

Mr. CHARLES FOWLER then read a paper on

The Cistercian Abbey of Maulbronn, Württemberg.

Mr. FOWLER began his paper by referring to the late Mr. E. Sharpe's mention of the Cistercian Abbey of Maulbronn, in Württemberg, in his valuable book on the "Architecture of the Order," which work had unfortunately never been completed. He pro-

posed to limit himself to a more detailed examination of that single example, believing it to be the one in which the buildings were in the most perfect state of preservation. It was chiefly from the account of the abbey given in a monograph by Dr. Paulus, Professor of the Theological Seminary which now occupies the monastic buildings, that the author was led to visit the place, and it was to that literary source he was indebted for his historical gleanings on the subject. The founder of the abbey seemed to have been a certain Walter of Lomersheim, but the ecclesiastical patron was Günther, Bishop of Speyer, who played the most important part in the work, and procured such endowments for the monks as enabled them to begin to build about 1147. The year was not certain, but it was known that the building was left unfinished at Bishop Günther's death in 1161. In May 1178 it was consecrated by Arnold, Archbishop of Treves. Bishop Günther was buried within its precincts, and his successors in the see of Speyer greatly favoured and protected the abbey, so that the monks were enabled to push forward their extensive additions to the original foundation. The site was picturesque and well-chosen in other respects as well. The church, like the rest founded by the Cistercians, was on a large scale and simple in architectural detail. The total length was 210 feet, the internal width 68 feet, and the height of the nave to the originally flat ceiling 62 feet, and in the aisles 28 feet. Externally the church appeared to have transepts of the same height as the nave, but internally they were reduced each to a low aisle, with three eastern chapels on each side of the sacristy. Over these cross aisles and chapels there was on each side a large chamber. That to the north formed the library. A spiral staircase led to that on the south. In the north transept a broad and easy flight of stairs led to the monks' great dormitory. The screen dividing the nave, and the piers of the nave were described and illustrated by drawings. The vaulting was in the simplest form, with ribs of bold profile or merely chamfered. A flat ceiling originally covered both nave and aisles. A fragment was left standing in the south transept. The remains of the original ceiling were particularly interesting as proving that the roof to which they are attached is the original roof, dating from the twelfth century. The original doors were also to be seen at the west end of the church. They were covered outside with thick parchment, which was painted, and over which was fixed the elaborate ironwork. In 1424 Abbot Albrecht IV. caused the whole of the church to be vaulted by the lay brother Bertholt. At the same epoch arches were cut through the south wall of the church, and ten chapels built; the two canopied altars in the nave probably dated from about the same period, as well as the fine oak stalls around the choir and the traceried choir windows. As to these windows, in a fresco, bearing the date 1424, and representing the presentation of the church to the Virgin by its founders Bishop Günther and Walter of Lomersheim, the east end of the church is represented with the window as now existing. The exterior of the church was plain almost to baldness, but the masonry was excellent, and the mouldings and details as sharp as when first executed. In accordance with the rule of the order there were no towers, but over the crossing there was a wooden bell-turret with a spirelet, which, however, seemed to Mr. Fowler not to belong to the original construction of the church roof. The Galilee porch at the west end of the church was a very interesting feature, and a remarkably good example of the transitional style of the thirteenth century, which produced so many fine works in Western Germany. It dated from after 1220, and was described in detail. The remainder of the more strictly ecclesiastical buildings of the monastery were grouped round the cloisters on the north side of the church. The great cellar, which was not of this class, was on the west side; it was 67 feet long by 35 feet broad. It was a peculiar feature at Maulbronn and was not found in any other of the principal Cistercian houses. Adjoining it were the entrance to the cloisters and the refectory of the lay brothers, both of which were described in sufficient detail. An inscription concurred with the evidence drawn from these particulars to date this sweep of buildings in 1201. On the north side was the monks' refectory, the finest building of the whole group. It stood in the usual position, about the centre of that side of the cloisters opposite the church—in this case the north side. It was 89 feet long, 38 feet broad, and 33 feet high to the crown of the vaulting. It was divided by a row of seven columns down the middle. As the description and illustrations proved, this fine hall was in the best style of the transition period. The whole was in a state of almost perfect preservation. Mr. Fowler believed the only restoration had been the glazing of the windows and the renewal of the pavement. A description of the kitchen followed, and another of the only warmed chamber in the whole range of the abbey buildings. Still fuller accounts were given of the cloisters, the chapter house and the abbot's house. This last was in great part rebuilt by Abbot Entenfuss (Duckfoot) in 1512, and his canting crest, a duck's foot holding a crozier, was carved on one of the pillars of the great hall. The Romanesque arcade at the back of this hall proved the original building to have belonged to the earliest erections of the abbey. Entenfuss's building was chiefly remarkable for its size, being 100 feet by 50 feet deep. The principal front had a picturesque oriel crowned with a lofty spire. The great hall was about 70 feet by 35 feet.

The building was now converted into residences for the masters of the seminary. Some walls and foundations to the west showed that the original building must have been much larger. The author concluded his paper by comparing Maulbronn with other Cistercian houses. He had already referred to its great cellar as an unusual feature, not seen in any of the English or French monasteries of the Order that he knew of; but he knew of at least one German parallel at Bebenhausen, near Tübingen, in Würtemberg. At least there was a similar arrangement, although the chamber was not thought to have been used as a cellar but as a parlour or conversation-room. Other architectural features met with at Maulbronn was also found wanting in English Cistercian houses, but reappeared in France and Germany, as at Clairvaux and Bebenhausen. This last, Mr. Fowler observed, is not included in the long list of forty-six monasteries of the Order given by Mr. Sharpe. Bebenhausen had been a good deal restored and altered. It was now a royal hunting château, and was picturesque enough to be well worth a visit. He could also confidently recommend to the profession a visit to Maulbronn.

Mr. R. H. CARPENTER said that he had not visited Maulbronn: he had no idea in fact when in the district that there was so interesting a building there. He certainly should pay it a visit. After referring to the planning of the Cistercian abbeys, he spoke of the windows. In the twelfth and thirteenth-century periods no doubt they were not as a rule glazed, but an instance of it occurred at Croxdale Abbey, a very perfect example of the thirteenth century. Speaking of the seminary building, he said that at Furness Abbey there was a building known as the School House, next the abbot's hall. The western porch might have been used for penitents, or possibly for the assembling of processions, as on Palm Sunday, or to and from the cemetery.

Mr. E. G. PALEY remarked that Maulbronn Abbey was a most interesting building. He knew none like it for the extent of its buildings, which, moreover, were in almost the same condition as when vacated by the monks. The building would no doubt enlighten us as to many points in which we had hitherto been in the dark. The peculiar crossing in the church was almost unique, and seemed to indicate the former existence of a tower. Another peculiarity was the absence of a vestibule to the chapter-house, which was invariably found in English abbeys. At Furness Abbey the windows, as a rule, showed no grooves for glass, but it was supposed that they had wood shutters or wooden casements filled with glass. Possibly it might have been so at Maulbronn, for it was not likely the monks were so hardy as to dispense with something of the kind.

Mr. T. BLASHILL called attention to a peculiarity in having three chapels on each side of the transept, instead of two as was usual. There was a building to the left of the north transept which seemed to be found in most of the abbeys, though seldom exactly alike in detail. Mr. Sharpe's conviction had been that it was the penitentiary, but he hardly thought such was the case. The size was generally the same, though sometimes it was a passage or dark cell, and in other cases well lighted. At Tintern Abbey there were external rabbets for glazing purposes. Afterwards grooves were made, and a return was again made to the rabbetting.

Mr. WYATT PAPWORTH having made some remarks,

The PRESIDENT alluded to the interesting subject that Mr. Fowler had brought before them. He believed that there was a great deal of work of the Middle Age period in the district about Maulbronn. The plan of the abbey and buildings was very charming in its regularity, and he thought there was considered to be a likeness between the architecture and that of the church of Our Lady of Treves. As to the suggestion of the penitentiary, the President said that another suggestion was that the building was used as a morgue or dead-house. The chapter-houses in ordinary cases were two out of a hundred not rectangular, while in the chapter-houses of the Cistercian abbeys there would hardly be two in a hundred that were not rectangular.

A vote of thanks was then passed to Mr. Fowler for his paper.

Mr. FOWLER, in his reply, said that he did not profess to have treated the matter exhaustively, for he had not gone into the subject thoroughly enough to enable him to do so. Having lighted on an extremely interesting building, he had done his best to bring it under their notice, and, as he had already said, it was in a singular state of preservation. No doubt there had been some little restoration, but they had the real thing itself. There might be here and there some little doubt what the purpose of certain parts of the building was, but there was the form of the building. The purpose of the small place next the transept had been much discussed; this one was exceedingly well-lighted. As to the Galilee porch, it had been suggested that it had been used for a consistory hall, as the abbots had considerable jurisdiction. Though the crossing was suggestive of a tower, he had found no indications of one having been carried up. The chapter-houses of the German houses had no vestibules to his knowledge. Bebenhausen was similar in this respect to Maulbronn. Mr. Fowler also adverted to the peculiarity in the monks' refectory, which was divided centrally by a row of columns which ran the whole length of the hall, and the entrance door opened in the centre of the end of the hall in line with the axis of the columns.

The meeting then adjourned.

"FAIRYLAND."

THE subject of the fourth and last lecture of Mr. Ruskin's present course at Oxford was the place of legendary art in the education of children. Having been himself brought up almost exclusively in fairyland, Mr. Ruskin said he had strong predilections, and was almost tempted to say that no story should be told to children which was not untrue, and no scene shown to them which was not impossible. But, divesting himself of such dangerous recollections, he acknowledged that, owing to the perfection attained within the last ten years in the art of printing in colours, there was now no limit to the amount of national and natural history which might be taught by this means. But it was a law of nature that the imagination was never keener than in childhood, and imagination, after all, consists in fancying something not there. No child will never take so much delight in a real tale of history as in the story of the shipwreck of a walnut shell in a gutter. So, too, no child has ever made a pet of a mechanical mouse or a doll that walks by machinery; but an ever-memorable little cousin of Mr. Ruskin's used to pet the knob of his stick, and even made a night-gown for it, finally asking her mother in timid and confidential whispers whether she had better make any sleeves, because as Bibsy has no arms perhaps she wouldn't like it.

It is the business, then, of art to entertain the childish imagination with graceful fancies. Mr. Ruskin dwelt on the word "graceful," for the popular fancy of the day too often teaches only disgrace, and is content with the representation of the queen of the fairies kissing a sentinel by Westminster Bridge. Even Scott's fancy of the *White Lady* fails of its effect, because in the ducking of the sacristan it is pushed to the length of an unbecoming jest. No doubt much may be allowed to the narrator which could not be excused in a painter; and perhaps this is the reason why our great artists have attempted so little in this direction. Even Sir Noel Paton's *Court of Titania* was painted rather to show the artist's exquisite power of minute delineation than to induce a momentary belief in fairy wonder; and for the rest, our painters have confined themselves either to the grotesque or to such ridiculous designs as that of "the genius of poetry riding on a swan." And for the most part art delights to put before children pictures of visionary terror, cruelty, and pain—of alligators swallowing babies or avalanches destroying villages—pictures whose inherent mischief is aggravated by the vileness of exaggeration. Other forms of nursery rubbish are hardly less contemptible; and Mr. Ruskin went on to describe the contents of two such nursery books he had lately seen. In one of them a benevolent fairy is "driving a matchless pair of cockatrices"—a sentence notable for many things, but chiefly for its implied lesson that all glory consists in driving "a matchless pair," and for its contempt of the beautiful fancy of the Bible, "the weaned child shall put his hand on the cockatrice's den." The other book was filled with sanguinary and loathsome scenes, one of them a battle between an ape and a crab; the crab is elsewhere said to have been much delighted, being a simple-minded creature, at watching the growth of a tree.

With all this mischievous vulgarity Mr. Ruskin contrasted the lovely dynasty of little creatures, painted for us by Mrs. Allingham and Miss Kate Greenaway. He had noticed in his third lecture that Greek art gave us no children, but up to the thirteenth century there were no Gothic children either. It was only when art was touched by Christianity, and when the Madonna and Child became the light of every honest heart and the joy of every pure soul that pictures of children were possible. The tradition of the beautiful child lasted long, and even Rubens's and Rembrandt's children are always beautiful. Then came a dark period in which children were ground to death by our mill-wheels, and the wealthy patrons of art could not conceive of the children of the poor except in vice and misery. It is only now, Mr. Ruskin said, that you are beginning to restore the quiet earth to the steps of children. Even Bewick never painted a child but in mischief, and Wilkie never drew a beautiful Scotch boy or girl. In literature "The Cotter's Saturday Night" was the beginning of the child benediction, carried on by Mary Russell Mitford, Wordsworth, and Dickens; until it burst out, like their own sweet Surrey fountains, in the exquisite art of Mrs. Allingham and Miss Kate Greenaway.

Mr. Ruskin had to confess that all the painters whom he had associated with his present course of lectures were badly represented in this year's exhibitions; and he could not sufficiently regret that Mrs. Allingham should have spent her time on single heads instead of doing what God made her for, and drawing all the lovely details of child life. But her former picture of the two deliberate little housewives with their two flat-irons, had already become a classic picture, and would remain when many loudly-trumpeted magnificences were remembered no more.

From Mrs. Allingham Mr. Ruskin turned to the hitherto undreamt-of and in its kind unrivalled genius of Miss Kate Greenaway—a genius which had already found recognition even in foreign countries. In support of this statement Mr. Ruskin read a translation of the passage on Miss Greenaway in M. Ernest Chesneau's "*La Peinture Anglaise*"—a book which he earnestly recommended to his pupils for the candour of its criticism and the exquisite finesse of its language; and he concluded his lecture with answering M. Chesneau's question whether Miss Greenaway's art

could go any further or do any better. In the first place, the public should see to it that her genius is no longer wasted on ephemeral productions. It is far too precious to be hidden in the corners of Christmas cards or stretched like elastic round an almanack, and it should be rightly employed in the illustration of connected stories. And secondly, Miss Greenaway should be given the opportunity of training a school of colour facsimilists. Mr. Ruskin had praised the skill with which colour-printing is now done, but he showed, by comparing some prints with the originals, how much of delicacy and detail was necessarily lost. There was no reason why beautiful things should not be multiplied indefinitely; and what happier occupation could an English girl wish for than to minister to the joy of all the children in Christendom.

And for his own Oxford pupils, well, he would tell them how they could create a fairyland in reality. "I was walking the other day," Mr. Ruskin said, "in St. John's College gardens, and they seemed to me, as they always do in spring time, to be almost an ideal of the earthly paradise, and there were young men playing there, preparing, perhaps, for the fairies of Commemoration. But next day I chanced to walk down St. John's Street until I came to one of those waste spaces with which you everywhere delight to adorn the suburbs and honour the entrances of your noblest cities, and of which I will only say that no dæmons could depict a more abominable Inferno for the condemned souls of dirty people. I have often told you before, and at the end of the first course of new lectures which I have been permitted to deliver to you, I wish to tell you again, if possible with greater vehemence, that there will never be sound art or politics or religion in England until leaving, if it be necessary, your own pleasure gardens and your pleasure chambers, you resolve that the streets which are the habitation, and the fields which are the playgrounds, of the poor, shall be restored to the rule of the spirits, whoso'er they be, that reward with constant and conscious care all that is decent and orderly and pure."

THE PARKES MUSEUM.

ON Saturday last the new Parkes Museum, 74A Margaret Street, Regent Street, was opened by H.R.H. the Duke of Albany. A report was first read by the Chairman of the Council, Captain Douglas Galton, in which it was explained that the object contemplated in establishing the museum was to found a central institution for the instruction of the public, where not only professional men, but owners of property, employers of labour, manufacturers, artisans, and other persons, both men and women, might study at their leisure the subjects in which they were most interested. Demonstrations and lectures would also be a permanent feature of the institution, and in order that it might be of benefit to the labouring and artisan class, the museum would be open free to the public during a portion of every weekday.

Sir Charles Dilke in proposing the first resolution, that the museum met an educational want and was worthy of the support of the public, said that in the office he now filled he was brought into connection with the enforcement of the Public Health Acts throughout the country, with the laws regulating the construction of the people's homes, with unhealthy and dangerous trades, the pollution of rivers, the purity of the water supply, &c. In considering these matters the feeling produced in one's mind was one almost of despair, so enormously extended was the field; but one must also be impressed with the great importance of facilitating the working of those laws by bringing home to the minds of the people of this country the purposes for which those laws were imposed by the Legislature.

Professor Tyndall, in seconding the resolution, said that the physician and the sanitarian have no longer to fight against phantoms, requiring only the fortuitous concurrence of atoms to bring them into existence. Their enemy is revealed; and their business is to thwart him, to intercept him, and to slay him. It is not noxious gases, but organised germs, which, sown in the body and multiplying there indefinitely at the body's expense, produce the most terrible diseases by which humanity has been scourged. Contagia are living things. Men and women have died by the million that bacteria and bacilli might live. Reason repudiates this sacrifice of the greater to the less, and will invert it, if possible. These virulent organisms, these ferments of disease, hang about the walls, the furniture, and clothes of the sick room. How is the room to be disinfected? They are diffused in the air of our drains. How is that air, which is sufficiently noxious on its own account, to be prevented from entering our houses? We know how typhoid fever is generally spread. How are our water and our milk to be protected from that contagion? Our hospitals, it is said, infect their neighbourhood. Is not this preventable? Through the downcast shaft of a coal mine the fresh air enters, sweeps the noxious gases of the mine along with it, and escapes through the upcast shaft into the open air. Can we not imitate this arrangement in our hospitals? Drawing for our intake upon the pure atmosphere, carrying it through the wards, and making it pass through a ventilating fire before finally ejecting it, no contamination of the surrounding neighbourhood would be possible. All these are questions for the practical sanitarian. They are

questions on which the Parkes Museum of Hygiene may be expected to throw light, and the council of the museum do not overstate their case when they speak of the vast importance of the work they have taken in hand.

The Duke of Albany in the course of his speech said: It is notorious that many of our public and private buildings in this country have been constructed without due attention, or, indeed, any attention, to those details which alone make a dwelling wholesome. The experiences of my own family in this matter have indeed been singularly hard. We hope that this museum will tend to hasten the end of this state of things, and that henceforward "healthiness" will be considered as an essential condition of true architectural beauty. For the healthiness of our dwellings we have to depend, not only upon the master mind which furnishes the plan, but even to a greater extent upon the intelligent hands of those who are called upon to carry out the details. Unless the work of these latter be done with intelligence and faithful honesty, the schemes of the wisest architect avail us little. The instruction which has been and will be given here to the artisans who carry out the sanitary details of our houses must be productive of good results. At least, let us hope that some of the specimens of defective workmanship to be found upon our shelves will impress upon them that death, disease, and sorrow may be the results of ignorance or carelessness on their part.

THE MANCHESTER ART MUSEUM.

THE Committee of the Manchester Art Museum in their annual report, which was read at the meeting on Wednesday, stated that they have endeavoured to carry out, as far as somewhat difficult circumstances have permitted, the programme of twelve months ago. The works belonging to the committee still remain in favour of the mayor in three upper rooms of the town hall. They consist, in round numbers, of fifty oil paintings, of which about six are excellent copies from the old masters, the rest original works; 220 water-colour drawings, 450 etchings, 180 copper and steel line engravings and mezzotints, 510 autotypes, a large number of chromo-lithographs, &c. It is contemplated to make a division of these works into two classes—one for a permanent collection, the other for distribution on loan to schools, and possibly to some other institutions. Many works are specially adapted to the requirements of those studying art, in fact offering means of connectedly studying particular masters and particular forms of art, such as it would be difficult to find elsewhere in the north of England. Others have been chosen with careful reference to the needs of scholars in elementary day and Sunday schools. The committee desire to express their thanks for the furtherance and support afforded by the chairman and members of the Parks Committee, and for the sympathy in all their work which has always been shown by the chief magistrates of the city. It is as yet premature to forecast the precise details of management when the new building furnishes a basis for new operations. Meanwhile the committee have not felt able to carry out designs which would not have been postponed but for the want of premises in which works of art could satisfactorily be shown, received, and distributed. They have been debarred from much work they would otherwise have attempted, but something has been done. The collection has been systematised, divided into classes, catalogued, and arranged with a view to its future uses. The committee have examined a number of wall-papers and textile designs in cotton and silk, comprising tapestries and damasks, chosen by Mr. William Morris, with a view to the special purposes of the committee. A selection of wall-papers and fabrics has been made, and a piece each of the former ordered. They are to be shown in schools as designs, educational in form and especially in colour. Mr. Morris has promised to write for each an explanation of the principles on which it is designed. Mr. Morris has promised to provide furniture and fittings for a model small house, which it is intended shall form part of the museum at Queen's Park. A commission has been given to Mr. Walker to prepare studies of trees and sprays of trees, which are to be lithographed. Some of the lithographed impressions are to be coloured by hand. Miss E. G. Thompson is commissioned to prepare copies of Mr. F. J. Shields's studies of Paul Veronese, illustrating the composition of this great master in its separate branches, viz.: 1. Arrangement of line. 2. Arrangement of light and shade. 3. Arrangement and massing of colour. It is unnecessary to point out the value of such analysis to art students. Mr. C. Rowley, jun., and Mr. F. J. Shields have been requested to buy in Paris a number of casts. Mr. Armitage has promised to select for purchase by the committee a small collection of Persian and Oriental fabrics similar to those presented by him.

The purchases of the year have been: Set of drawings of birds, by Keulemans; twenty lithographs from Gould's *Birds of Great Britain*, coloured by hand; autotype of the late D. G. Rossetti's *Lady of Pity*; Goupil's coloured photograph of *The First Ride*, and two other similar works; a series of engravings and etchings chosen as memoranda of the best works of the best masters; Turner's Bible Illustrations (Finden's Bible); the whole of the engravings, by Turner, illustrating the works of Sir Walter

Scott, from the first edition; a cast of *Pallas Athene*; eight pictures bought at the Mitchell sale, including specimens of Basil Bradley, W. Morton, Mitchell, and studies after great colourists by Mr. F. J. Shields. Mr. Davies has executed a commission for a drawing of a leafless ash tree, and has received a further commission for a drawing of the same tree in full foliage. A considerable sum has been expended in framing the pictures bought during the year. The committee appeal for further assistance. They need an annual income of about 500*l.* for the salary of a secretary and other expenses, and at least 5,000*l.* to complete the collections for the museum and for schools. Many more pictures are needed, both for the museum and for schools. Of some classes of work the committee have as yet scarcely any examples. They desire to obtain casts of Greek sculpture, as examples of beautiful form; beautiful and cheap European pottery, as well as specimens of Chinese and Japanese pottery, exemplary in colour and form; bronzes, enamel-work, further specimens of textile fabrics adapted to develop taste, and many other kinds of art which are within the scope of the work, but at present beyond the means of the committee.

TIMBER STAGES AND THE BUILDING ACT.

A SUMMONS taken out by Mr. Frederick Wallen, the district surveyor of St. Pancras West, against Mr. T. J. B. Cobbett, for erecting a timber stage at Drummond Street, Euston Road, came on for hearing before Mr. De Rutzen at the Marylebone Police-court on Wednesday, May 23.

Mr. Wallen stated that in January last he noticed a timber stage had been begun to be erected by Mr. Cobbett on some land in the rear of Drummond Street, Euston Road. He spoke to defendant about it, and said it was a building and must be enclosed by brick walls and a roof, and he advised him that if he wanted to erect it he had better apply to the Metropolitan Board of Works for special sanction. He was informed that defendant suspended the works and adopted this course. Subsequently he found defendant had completed the timber stage, and he therefore took out the present summons. The stage was 28 feet by 22 feet on plan. It consisted of nine posts and six beams at top resting on them, and was open all round and had no roof. He considered it was a building, and the builder of it should give notice of its erection and enclose it with brick walls and a roof. He relied on the evidence of its being legally a building on the decision given in the case of *Gourley v. Stephens*, 7 C. B. N.S. Mr. Richard Nevill, barrister, who appeared for the defendant, cross-examined Mr. Wallen on his reasons for taking the present proceedings. Mr. Wallen admitted he had never, since the passing of the Building Act, heard of a district surveyor having summoned a builder or owner for erecting a timber stage. It was the first time the case had been tried to his knowledge; he thought it was time the question was settled. He had never summoned anyone himself before for such a matter. He was aware that when the Metropolitan Board of Works passed the Building Act Amendment Act of 1878, they tried to obtain powers over timber stacks and stages, and that the Timber Trades Association strongly opposed these clauses of the Bill, and they were withdrawn and the Bill passed without them. In his opinion the Board did not want these powers, as they already, he thought, had them through the district surveyors under the 1855 Act, and that is why they withdrew such draft clauses. Mr. Nevill placed in Mr. Wallen's hands a copy of the draft clauses, making the erection of timber stages above a certain height within 30 feet of a public way an offence under a penalty of 5*l.* and 40*s.* per day, and asked if he was aware these were withdrawn. Mr. Wallen replied he was; but he still thought the Board of Works only applied for these powers because they were ignorant that the 1855 Act included them. The present summons was taken out at his own instance; he had never heard of a summons of this description before. Mr. Nevill asked Mr. Wallen, supposing the three top cross-beams were removed, would he still consider the three separate frames a building?

Mr. Wallen: Yes; three separate buildings. They must each of them have walls round them and a separate roof.

Mr. Nevill: If three posts were erected in a gentleman's garden in the suburbs, with a cross-beam at the top for a children's double swing, would that be a building?

Mr. Wallen: Yes; but as a district surveyor, I should probably not notice it.

Mr. Nevill: In such a case you would neglect your duty, considering it too small to look at?

Mr. Wallen: Yes, it is a question of the size of the structure.

Mr. Nevill, for the defendant, submitted that the staging could not possibly be a building under the Act. It was simply a stage or scaffold for drying timber on; and if Mr. Cobbett and persons in the timber trade were not allowed to use such stages, their yards would be useless and the trade would be entirely driven out of London. It was the first time Mr. Wallen had ever raised such a question. The Act had been in operation twenty-eight years, and if Mr. Wallen were right, all the other district surveyors in London during all that time had been wrong and neglecting their duty, which inference was absurd. The Board of Works had, however,

practically settled the question, as they had recently applied for powers over timber-merchants' yards and timber stages, which were refused, and they had to withdraw all the clauses in their Bill relating to them. These stages had been erected more or less all over London.

The following witnesses were then called on behalf of the defendant:—

Mr. Hamilton, architect and surveyor, who said he had been in practice for several years, and was formerly principal assistant to the district surveyor of Hackney. Had inspected a large number of stages. Had never known them to be brought under the Building Act as buildings, unless they had a roof over them. An assemblage of nine posts, with six cross-beams over them, could not be a building; it was a trade fixture. He had never known a district surveyor take proceedings with respect to a timber stage. Cross-examined: The application made by Mr. Cobbett to the Metropolitan Board of Works was for a totally different structure to this. It was for a structure with a roof, and partly enclosed. This was simply an open stage.

Mr. T. Merrifield stated he was a clerk of works; had been one for twenty years. Never knew a timber stage treated by a district surveyor as a building. It was a trade fixture. Cross-examined: Considered the stage in question could not be a building, because it had neither top, sides, or bottom. It was open to the sky, and stood on the earth. It was a trade implement.

Mr. De Rutzen said he would give his decision on June 6.

Mr. Nevill: Will you kindly so state it that if it is against the defendant he can go to a superior court.

Mr. Wallen: There is no appeal. It is simply a question of fact.

The Magistrate: I shall be happy to let you take the case to any superior court. It is a legal question whether a stage is legally a building or not.

CHETHAM HOSPITAL, MANCHESTER.

THE first ordinary meeting of the Lancashire and Cheshire Society was held on Saturday in the great hall of Chetham Hospital. Professor W. Boyd Dawkins, F.R.S., the chairman, expressed his pleasure that their first working meeting should be held in a building that had so many archaeological and literary associations. Mr. Henry Taylor then read an elaborate paper on the history and architecture of the building, which he regarded as being for the most part of the time of Thomas La Warr, who founded the College in 1422 as a home for the clergy of the old parish church. In this building there were probably incorporated portions of the earlier one, which, under the name of the Baron's Yard, formed a strong defensive structure well placed at the confluence of the Irk and the Irwell. The changes made in quite recent times somewhat obscured the appearance of a locality that had been admirably chosen for purposes of defence. Whitaker had conjectured that it stood on the site of a summer camp of the Roman garrison, but of this there was no evidence. The Baron's Hall after its conversion remained the residence of the clergy until 1547, when it was dissolved and passed for a time into the hands of the Stanleys. It had been said that for a time it was used as the town house of the Earl of Derby, and his crest was found in one or two places. Mr. Taylor by means of maps, plans, and drawings explained the probable arrangement of the hospital and its successive alterations, some of which he was inclined to attribute to the period when it formed part of the Stanley estate. During the civil wars it fell into a ruinous condition, and, although there was no documentary evidence to that effect, was probably considerably altered when it was bought by the feoffees of Humphrey Chetham. At the conclusion of the paper the Ven. Archdeacon Arson moved a vote of thanks to the reader. Mr. J. H. Nicholson in seconding the resolution said that Mr. Taylor's paper, the result of careful and patient study, was an auspicious beginning of the labours of the Society. The motion having been adopted by acclamation, the party then proceeded to the auditorium, where the Archdeacon called attention to the grotesque carved boss representing Saturn devouring a child. This the popular imagination had converted into a representation of the giant Tarquin, who was said to have exacted a baby for breakfast each day from his oppressed vassals. The contents of the reading-room and library were briefly described by Mr. J. E. Bailey. In the small quadrangle adjoining the lower cloisters, Mr. Taylor pointed out the probable alteration of the entrance from the Great Hall now concealed by the grand staircase, which was probably added by the Earl of Derby. In the kitchen Mr. Taylor observed that they were not in the position usually assigned to such office in similar structures. It was doubtful whether there had been a gallery. The party then adjourned to the back of the College on the bank of the Irk, where the course of the river and the situation of the fortified structure were further explained. After an examination of the old entrance and of the dormitories the party re-assembled in the Great Hall, where the proceedings ended with a vote of thanks to the feoffees and to Mr. Hanby, who had afforded every facility in his power for a thorough examination of the structure.

LEGAL.

Court of Session, Edinburgh (First Division).—

Saturday, May 26.

APPEAL.—JAMES N. THOMSON (TRUSTEE OF J. R. HORNE) *v.* JOHN CARRICK AND OTHERS.

DEFECTIVE BUILDING SITES.

The question raised in this appeal is as to whether certain ground in the neighbourhood of Holyrood Crescent and Napiershall Street, Glasgow, is in a fit condition to be built upon. The deceased Mr. Horne was proprietor of the ground in question, and he applied to the Dean of Guild for power to erect buildings upon it, but the application was dismissed. Mr. Horne died, and Mr. Thomson, an accountant in Glasgow, was appointed trustee on his estates. In the interests of the creditors he subsequently made a similar application to the Dean of Guild, but it was objected that, as the ground had recently been quarried extensively to a great depth, and had been filled up with rubbish and loose earth, it had not had time to solidify, and would therefore be dangerous to build upon. Again the Dean of Guild refused the application, and an appeal was taken to the Court of Session, Mr. Carrick, Master of Works, and others being called as respondents. Mr. Carrick did not appear, but certain neighbouring proprietors opposed the appeal on the grounds that the authority asked was barred by certain building restrictions in the titles; that there had been a road over part of the petitioner's ground, which he must replace before he could build; and that the causeway of Holyrood Crescent should be widened.

After consideration, their lordships of the First Division remitted to the Dean of Guild to reconsider his judgment, with power to recall his interlocutor; and if he should adhere to his interlocutor, to specify the grounds on which he proceeds. The Dean adhered to his former interlocutor, and the Court at a later date recalled his judgment, and remitted to him to allow the erection of the buildings in question, if the fact that the ground upon which they are to be made having been quarried did not make them dangerous. The Dean being of opinion that it would be dangerous to allow buildings, the appeal was again brought under the notice of the Court on Saturday.

Counsel for the appellant submitted that the objection of the respondents that it would not be safe to build upon this ground, which had formerly been a quarry, was not well founded. He was quite prepared to prove that it was safe to build upon it, and he wished inquiry by the Dean of Guild in order that he might come before their lordships fortified with evidence on the question. He pointed out that the Dean of Guild was a shipbuilder, and knew nothing about buildings, and his assessor was an assistant town-clerk, well qualified for writing interlocutors, but knowing no more of buildings than the Dean of Guild himself. The Dean had been asked to inspect the ground himself, but had declined to do so, and nobody had inspected it. He had been also asked to listen to the evidence of skilled witnesses on the matter of safety, but had declined.

The Lord President said that if the statements were correct, then it would be dangerous to build upon this ground, because the respondents said that the ground had lately been quarried to a great depth, and only within the last three years had been filled up with rubbish and loose earth.

Counsel stated that that was no new averment on the part of the respondents, as it had been made in the previous proceedings. For instance, they said to the Dean of Guild that the ground had been quarried to a depth of 60 feet, whereas it had been proved that the depth was only 27 feet. They further stated that it had been filled up only two or three years ago, whereas it was really six or seven years ago, and instead of being filled up with rubbish and loose earth the ground had been excavated from Holyrood Terrace.

Lord Shand asked how it was that the trustee on a sequestrated estate should propose to build in this way.

Counsel answered that it was the only way of realising the value of the land.

Lord Shand said it was surely a very unusual thing for a trustee thus to speculate.

Counsel did not think it was unusual, and so long as he had the authority of the creditors he was entitled to do this. He further contended that the fact Mr. Carrick had been cited and had not appeared showed that he was satisfied.

Up to this stage no one had appeared for the respondents, but a counsel now entered the court and stated that his instructions were that he should not appear, and he said the respondents did not propose to take any further action.

The Lord President, however, thought that the appeal ought to be intimated to the Master of Works, and if he found it necessary he might consider it his duty, in the public interest, to look into the matter.

Lord Deas said he was not worth his salt if he did not.

Their lordships then, in respect that the respondents no longer insisted on their objection, and made no appearance, appointed that intimation be made to the Master of Works, in order he

might, in the interests of the public, consider the proposal of the appellant as to the foundations of his proposed building, and, if necessary, to enter an appearance as respondent.

Timber Stages and the Metropolitan Building Act, 1855.

SIR,—It was assumed by Mr. Wallen, the district surveyor of St. Pancras West, on Wednesday last, when he summoned Mr. Corbett for erecting a timber stage as a building, contrary to the Act, that there had hitherto been no legal decision on the question. In this, unless I am mistaken, he is in error. It is quite true that no district surveyor has ever yet raised the question, but it has been raised by other public bodies at Bow Street Police-court, as the following statement will prove.

In June 1871 a summons was taken out by the Strand District Board of Works against Mr. Macey, contractor, of Milford Wharf, Strand, for erecting a large timber stage on the land forming part of his premises on the Thames Embankment; the question was heard at great length. The Metropolitan Board of Works supported the Strand District Board in the case, and Mr. G. F. Fry, the surveyor to the Strand District, and Mr. Vulliamy, the superintending architect to the Metropolitan Board of Works, gave evidence for the prosecution. Mr. Whichcord, F.R.I.B.A., was also called in. Mr. Vaughan, the magistrate who heard the case, went into the question at issue at great length, and inspected the plans; and he afterwards met the various surveyors on the spot, and himself inspected the stage. Finally, on July 8, 1871, he gave his decision that open timber stages were *not* legally buildings, nor included in the provision of the Metropolitan Building Act, and dismissed the summons. Mr. C. J. Shoppee acted on behalf of Mr. Macey in the case.

There are many surveyors who could have put Mr. Wallen right as to the particulars of this question. It is quite true the Metropolitan police magistrates are not compelled to recognise any decision but that of a superior court; but doubtless Mr. Vaughan had good reasons for his decision, and there is no doubt that their want of success in this instance caused the Metropolitan Board of Works to insert the clauses in the 1878 Draft Bill to attempt to regulate timber stages, which were rejected. What becomes, therefore, of Mr. Wallen's argument?

Yours obediently,

London: May 29, 1883.

A TIMBER MERCHANT.

NEW BUILDINGS.

Wellington.—New public buildings and offices for the Improvement Commissioners, Wellington, Salop, have been opened. The main building is arranged for an engine tender's house and offices, double engine houses, surveyor's office, with fire-proof room and all business fittings, entrance lobby and main staircase, lavatory, and other conveniences, landing arranged as waiting lobby, a commodious Board-room, 26 feet by 16 feet, and 14 feet high, with cove ceiling and bold oriel window. This room is ventilated by a large Boyle's air-pump ventilator. The style of the building is free Classic of the eighteenth century. The sole contractor was Mr. Oliver Jones, of Shrewsbury, under whom the stonework was done by Messrs. Marshall, of Shrewsbury and Wellington; the carving and sgraffito work by Mr. Landucci, of Shrewsbury; the plumbers' work by Mr. G. Evans; grates and bells by Messrs. Benbow & Davies, gas-fittings by Mr. Edward Millington, both of Wellington; and painting by Messrs. Marston Bros., of Shrewsbury and Wellington. Mr. John Lawrence Randal, F.R.I.B.A., of London and Shrewsbury, is the architect.

CHURCH BUILDING AND RESTORATION.

Burton.—A mission church has been opened. It has been built from the designs of Messrs. Giles & Brookhouse, architects, Derby, by Messrs. Lowe & Sons, contractors. Messrs. Stevenson & Sons were the joiners.

Oxford.—The memorial-stones of a Wesleyan chapel have been laid. The building, which will cost about 3,000*l.*, is the design of Mr. Mullett Ellis, Old Jewry, E.C. Messrs. Wilkins & Sons, Eynsham, are the builders.

Llandaff.—The ancient church of Mathern, near Chepstow, has been reopened after improvements carried out from the designs of Mr. Pritchard, diocesan architect, and Mr. Ewan Christian, architect to the Ecclesiastical Commissioners. The church claims, like that at Trellech, to have been founded by princes of the British

race, but of the British church no traces remain. In the existing structure, however, at the western extremity of the arches separating the nave from the north aisle, is work supposed to be Saxon; the pillars are of rude masonry, with square capitals, and the head of the arch is formed of two stones slanting obliquely. The remainder of the arcade apparently is of the second half of the twelfth century, the arches being round-headed, resting on moulded columns. The greater part of the exterior, including the tower (considered by Mr. Freeman to be the most beautiful of its class in Monmouthshire), is Perpendicular of the fifteenth century. Close to the church stands the castellated palace built by Bishops John de la Zouch and Miles Salley, after the palace at Llandaff had been destroyed by Owain Glyndwr, and which continued to be a favourite place of residence with the bishops till early in the last century.

York.—The new church of St. Lawrence, without Walmgate Bar, has been opened. The style is Early English, and the building has been erected at a cost of 7,000*l.*, from the designs of Mr. J. G. Hall, of Canterbury, by Messrs. Keswick & Sons, builders, York.

SANITARY WORKS.

Public Baths.—For the proposed public baths for the district of Pendleton the design of Mr. Lawrence Booth, architect, King Street, has been accepted. Messrs. Mangnall & Littlewood, Brown Street, were awarded 30*l.* for the second design; and Mr. A. Darbyshire, Brazenose Street, 20*l.* for the third. The new baths, it is estimated, will cost 5,000*l.* Provision is made for two swimming-baths, first and second-class. The first-class bath, which it is proposed to set apart on certain days for the exclusive use of females, is to be 54 long by 24 feet wide, and the larger one or second-class, 75 feet long by 28 feet wide. Thirty hot and cold water and shower baths, attendants' rooms, &c., are arranged for. The structure is to be of red brick, with terra-cotta facings.

GENERAL.

Sir Savile Lumley has presented his collection of ancient and modern medals to the Numismatic Department of the Royal Library at Brussels.

Mr. Alma Tadema is now at Castellamare seeking materials for future paintings.

Mr. W. J. Morley has been appointed architect for the new Wesleyan chapel which is to be erected in the Grove, York. The style will be Italian.

The late Dr. W. Chambers has bequeathed a sum of 5,000*l.* to the Watt Institution and School of Arts, Edinburgh.

An Anonymous Benefactor has promised two sums of 500*l.* for this year and next year, respectively, towards the erection of an additional church for the parish of Wallsend.

The Truro Cathedral Committee held a meeting on Monday. The report of the committee showed great progress with the works, and, in referring to Dr. Benson, they spoke of him as one who was always at hand to assist and advise, and who watched the progress of the work of the cathedral with the eye of an architect, and with as much delight and affection as if the growing fabric had been the creation of his own mind.

The Birkenhead Board of Guardians have decided to build a new hospital for 150 patients, and to utilise the present one for housing the aged and infirm of the district. The cost is roughly estimated at 8,000*l.*

Messrs. G. B. Nichols & Sons, of London and Handsworth, have been appointed architects for the new Leamington Board Schools.

Mr. J. W. Trounson, of Penzance, has obtained the prize in the competition for plans of addition to the West Cornwall Dispensary.

The "Carlisle Journal" says that the alabaster discovered on the Duncowfold estate has now been tested and proved, seventeen feet of solid rock having been bored through.

A Public Museum is proposed to be established in Middlesbrough.

Kershaw's Patent Pneumatic Ventilators have recently been adopted at Baildon church, near Bradford; Cockerham schools, near Lancaster; offices of the North-Eastern Railway, York; Grange church, Kendal Conservative Club, Carnforth schools, Lancaster County Asylum, Lancaster Workhouse, a number of private residences, &c. These ventilators have also been fixed on the roof of the Industrial Exhibition now open at Stockport, and the excessive heat of the interior, which before their adoption proved so very unpleasant, has been entirely remedied. They have already been found to work most effectually, and now, although the building may be crowded to excess, a pure atmosphere is maintained which makes one's visit far more agreeable than heretofore. Mr. Kershaw's exhibit is well worthy of careful inspection by architects and others interested in scientific ventilation.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 2, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

MAIDSTONE.—June 15.—Designs are invited for a Chapel to be Erected on a Site near the Workhouse at Coxheath to accommodate 350 persons. Mr. R. Hoar, Solicitor, 9 King Street, Maidstone.

NEWCASTLE-ON-TYNE.—July 4.—Designs are invited for a Police Station and Fire Brigade Station to be Erected on the site of Westgate Police Station. Mr. Hill Motum, Town Clerk, Town Hall, Newcastle-on-Tyne.

YEovil.—July 1.—Designs are invited for Swimming Baths, &c. The Borough Surveyor, Yeovil.

CONTRACTS OPEN.

ACCRINGTON.—For Building four Dwelling-houses and Workshop. Mr. H. Ross, Architect, 5 Birch Street, Accrington.

ALVERSTOKE.—June 4.—For Further Works in Church Restoration and Enlargement. Rev. W. Durst, Alverstone Rectory, Gosport.

ARLECDON.—June 5.—For Enlarging Boys' School. Mr. J. B. Wilson, Surveyor, Roper Street, Whitehaven.

ASHTON.—June 4.—For Building two Houses. Messrs. T. D. & J. Lindley, Architects, Ashton-under-Lyne.

ASTON.—June 4.—For Additions and Alterations to Union Offices, also to Children's Department of the Workhouse. Mr. Yeoville Thomason, Architect, 40 Bennett's Hill, Birmingham.

BEDALE.—June 6.—For Building Young Men's Institute. Mr. G. F. Merrin, Secretary, Bedale.

BATLEY.—June 2.—For Building Chapel, School, and Cottage. Mr. J. T. Law, Architect, 64 Commercial Street, Batley.

BATLEY.—June 8.—For Building Wesleyan Chapel at Purlwell. Mr. G. A. Fox, Architect, Ward's Hill, Commercial Street, Batley.

BETH.—June 11.—For Building Constabulary Station. Messrs. McDermott & Murdoch, 62 Sandgate Street, Ayr.

BLACKBURN.—For Tower and Spire at St. Michael's Church. Mr. F. J. Robinson, Architect, 45 Friar Gate, Derby, and Blackburn.

BRADFORD.—June 2.—For Building Mill, Shed, Boiler-house, &c. Mr. G. C. Gamble, Architect, 4 Wellington Terrace, Laisterdyke, Bradford.

BURNLEY.—June 11.—For Building Co-operative Premises. Mr. T. Dean, Architect, 21 Nicholas Street, Burnley.

CALLOW.—For Alterations to Church. Mr. A. G. Lloyd Oswell, Architect, Pride Hill Chambers, Shrewsbury.

CAMBRIDGE.—June 8.—For Enlargement of Guildhall. Mr. E. Foster, Town Clerk, Cambridge.

DERBY.—June 14.—For Additions and Alterations to Property of Liversage Charity. Messrs. Lingard & Buchanan, Surveyors, Rodney Chambers, Derby.

DUBLIN.—June 6.—For Alterations to Building for Dispensary. Mr. W. H. Byrne, Architect, 52 Dame Street, Dublin.

EAST CROYDON.—June 9.—For Offices, Dwellings, Stores, and Stabling. Mr. M. Lawrence Caley, Architect, Broadway Chambers, Tunbridge Wells.

FAVERSHAM.—June 19.—For Alterations to Present Bakery, New Oven, Cooking-room, Coach-house, &c., for the Faversham Co-operative Industrial and Provident Society (Limited). Plans and Specification may be seen at the office of the Society from June 4. Mr. Edwin Pover, Surveyor, Faversham.

FORDINGBRIDGE.—June 4.—For Bakehouse, Coachhouse, and Van Shed. Mr. F. Bath, Architect, 342 Strand, W.C.

GLASGOW.—July 1.—For (Contract No. 2) Executing, under One Contract, the Works in connection with the Erection of the Proposed New Municipal Buildings, including Mason, Bricklayer, Carpenter, Slater, Plumber, Smith, and Founder Works, and Fireproof Construction. The Plans and Specifications may be seen, on and after June 1, at the Office of Messrs. Douglas, Hunter & Whitson, 197 St. Vincent Street, Glasgow.

HORLEY.—June 9.—For new School and Alterations to present School. Mr. Walter Kelsey, Architect, Bonehurst, Horley.

JARROW-ON-TYNE.—June 4.—For Building the Liddell Dispensary. Messrs. Austin & Johnson, Architects, 3 Arcade, Pilgrim Street, Newcastle-on-Tyne.

LAUNCESTON.—June 4.—For making Additions and Alterations to the present East Cornwall Bank House in Broad Street, and for Building a new Shop adjoining. Mr. Otho B. Peter, Northernhay, Launceston.

MONAGHAN.—June 16.—For Building Convent Chapel of St. Louis. Mr. William Hague, Architect, 62 Dawson Street, Dublin.

MONTROSE.—June 8.—For Construction of River Wall and Low Water Wharf, with Embankment for Tramway at Harbour. Mr. David Cunningham, C.E., Dundee.

MORLEY.—For Erection of large Wesleyan Sunday Schools. Mr. Walter Hanstock, Architect, Branch Road, Batley.

NEWCASTLE-EMLYN.—June 2.—For Building Mansion and Stables. Messrs. Middleton & Son, Architects, Cheltenham.

PLYMOUTH.—June 14.—For Building Five Houses, Woolster Street. Mr. W. M. Tollit, Architect, Totnes.

PENRITH.—For Building Detached Residence, Stabling, Outbuildings, and Boundary Walls. Mr. G. D. Oliver, Architect, Bank Chambers, Carlisle.

REDDISH.—June 18.—For Erection of Police Station and Strong Rooms. Mr. W. T. Gunson, Architect, 10 Marsien Street, Manchester.

RODLEY.—June 2.—For the Erection of New Schools. Mr. W. Lee, Clerk to the Leeds School Board, School Board Offices, Leeds.

SOUTHAMPTON.—June 4.—For Building Receiving Cottage, Old Penitentiary Premises. Mr. E. T. Howell, Architect, 16 Portland Street, Southampton.

STAFFORD.—June 8.—For Resetting Boilers and Rebuilding Chimney Stack at the Union Workhouse. Mr. N. Joyce, Architect, Greengate Street, Stafford.

SUNDERLAND.—For new Timber Quay and Crane Foundations, Monkwearmouth Shore. Mr. Joseph Potts, jun., Architect, 18 Fawcett Street, Sunderland.

TYNEMOUTH.—June 7.—For Building Chancel, Organ Chamber, Vestry, &c., at Holy Saviour's Church. Mr. F. R. N. Haswell, Architect, 17 Howard Street, North Shields.

WHITLEY.—June 6.—For Taking Down and Rebuilding Bridge near Sewage Works. Mr. E. J. Purnell, C.E., City Surveyor, Coventry.

TENDERS.

CLEVELAND WORKS.

PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C.: April 9, 1880.

DEAR SIR,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleaned, which I need hardly say is of great importance.

Messrs. FRANCIS & CO.

I am, Dear Sirs, yours faithfully,

HENRY CURREY, ARCHITECT.

Sole Manufacturers:—FRANCIS AND CO., VAUXHALL, LONDON, S.E.

TURNER'S IMPERIAL CONCENTRATED

**TURNER'S
SIZE
POWDER.**

SIZE POWDER

FOR THE IMMEDIATE MANUFACTURE OF SIZE.

Specially prepared for the use of House Painters, Decorators, and Manufacturers. Celebrated for its purity and strength. Guaranteed free from anything calculated to injure Colour or Fabric.

This Preparation possesses the following advantages over ordinary Size:—

- 1.—It is cheaper, being equal to ten or twelve times its weight of Patent Size.
- 2.—It is more efficient, the Size made from it being more tenacious, and perfectly pure.
- 3.—It is more convenient, a Size of any strength, and in any required quantity, being made at any minute, thus saving time and waste.
- 4.—Will keep any length of time in a dry place, and is therefore never liable to become mouldy, or acquire a disagreeable smell.

This Powder supplies a want long felt by all users of Size, as it at once does away with the great inconvenience of the old method, and supplies a Size both cheaper and more efficient.

Packed in Cases containing 28, 56, and 112 1-lb. Packets. Samples, Prices, and Testimonials on application.

PREPARED ONLY BY THE ORIGINAL MAKERS,

W. J. TURNER & CO., LEATHER, PARCHMENT, & GLUE WORKS, STOURBRIDGE.

The Architect.

SPECULATION ARCHITECTURE.

EVERY of our readers, perhaps, will at once understand what we mean by the phrase "Speculation Architecture." Everybody knows what speculation building is, and what part the speculation builder plays for the good, or not, of the public. Some may have heard that he is a pushing man—a very pushing man—and may be prepared to admit that there are possibly architects to be found who are so very pushing also as to put themselves so far on a par with him. But there are those who, happening to be behind the scenes, will be able of their own knowledge to testify to the fact—and this is what we have in our mind—that certain architects at the present day do in reality perform such important functions in the promotion of building operations of high class in London, and, to some extent, elsewhere, that, but for their instrumentality, what is done certainly could not be done, or at any rate would not with anything like facility.

To bring the case to a simple statement, it is this: that probably the greater number of the most formidable enterprises in the way of joint-stock building which we see undertaken are not merely encouraged by architects as private advisers, in the hope of getting business, but actually originated by them as primary financial promoters, risking expressly the money of their friends, and even their own, as a mode of directly creating business. Let it not be hastily supposed, however, that we are already insinuating disrespect for them, or disapprobation of their mode of procedure; all that we have to suggest for the moment is that the speculation architect performs so essential a part in the improvement of London, and of some other of our great towns in their degree, that professional disrespect and disapprobation come to be quite out of place in our recognition of his proper commercial position. In fact, some of our very foremost architects follow this business of speculation, and do so of their own choice, whilst others equally eminent who do not, only wish they could.

It has become the fashion now with auctioneers and other such sprightly agents, when they find themselves entrusted with the disposal of a piece of ground of any importance in a leading thoroughfare of business, to issue a circular, addressed to architects at large by means of the Directory, asking the plain question whether any one of them has a client who would wish to embrace the opportunity of becoming possessed of the site for the erection of suitable premises. This points to two things: first, that men of business who desire to build for their own trade are supposed to put themselves in the hands of their architects, in order that these may be on the look-out for an appropriate site; and secondly, that architects in general are supposed to be open to any proposal that may accidentally come before them, with a view to their finding a customer who will honour the introduction by employing the introducer. But when the piece of land is of the highest class, this latter supposition may be carried a little further, and it is sufficiently well known that architects are to be met with, who, having capital at their back—chiefly through the means of solicitors who are in reality money-dealers—are always on the outlook to find an opportunity for getting up a joint-stock company, or a syndicate, or whatever else may be the suitable name for the suitable agency, to speculate in building on a large scale.

Ardent young men are frequently found wondering why it is that the great hotels, business offices, blocks of chambers, and other such edifices of pretension, are not put out to competition. Do not "the promoters" know that they have only to ask and they will receive fifty or a hundred designs for nothing, the fruit of the highest genius of the day, from amongst which they may choose at their pleasure one which, if not always the best, can hardly fail to be any number of times better than the sort of thing they accept, and so on, at the hands, no doubt, of some undiscoverable old fogey, who, it is to be presumed, is thrust upon them by blind counsel, or by accident, or what not, and whose ideas are, &c., &c.—in short, very dull and very much behind the age? Little do these

enthusiastic artists know that the dullard in question is simply an exceedingly sharp man of business, who thoroughly understands men and markets, and without whose special intelligence the whole clever enterprise would be as good as no enterprise at all. But so it is. Sometimes the speculation architect is even an able artist; but if so, he is one of the right sort, namely, the truly practical sort. Still more frequently he is a sound constructor. But of necessity he is always a perfectly safe administrator of building business; for a man who blunders once is not likely to have a second trial in work of this kind. To describe him, at his best, in few words, he is a man of strictly commercial mind, so well up in all building matters, and so keen and active therein, that he is able to pilot the largest undertaking, from its first inception to its final consummation, with a certitude which many of his professional brethren, accustomed only to small operations, which, the smaller they are, are the more fussy, could scarcely credit. The secret of his success, all the while, is no secret at all; he understands his market, and that is enough. All he wants is money, although money in large amount; and why he gets the money is simply because his calculations of outlay and returns are the perfectly reliable calculations of an experienced man of business. One thing which he is especially devoid of is sentiment; for all the poetic feeling in the world will fail to make an account balance that won't balance, or to overcome the effect of an unforeseen loss, or in any other way to convert a failure into a success. As an illustration, let us refer for a moment to the well-known vexed question of "extras." As a rule, every architect gets his client into extras; this, at least, is the language of the client, the architect's view of the misfortune being that every job drifts of itself into extras, in spite of all that can be done by himself or anyone else. But in the last generation there were some architects—there may be some now for what we know—who could make it a boast that they never knew what it was to have extras. We have heard of one of these gentlemen who met the incredulity of a client by offering to send for a lawyer, and then and there to execute a bond. But the question is how the extras were actually avoided. There have been various explanations hazarded, of course; but we are inclined to doubt whether any general rule ever existed. The secret was, and is, that good administrators can provide for contingencies. "Nothing is certain to happen," as Lord BEACONSFIELD well put it, "except the unforeseen;" and clever managers make clever allowances for the unforeseen. Our speculation architect is one of these clever managers, and the agency of such a one in large building speculations is obviously a thing of the utmost importance. Success, in other words, is everything, and accurate foresight is the only basis of success.

Whilst, however, we are thus doing our best to claim honourable recognition for a class of architects whose usefulness is so great, we cannot deny the fact that a bungler at this peculiar kind of business is an undesirable friend to know. It is well understood that some of our extensive speculation buildings turn out a dead failure. The "original shareholders" are sufficiently often losers of all, or nearly all, their investment, to make this very term almost suggestive of misfortune. But this happens when one of two preliminary errors has been committed. Either the advising or promoting architect has been a bungler at the work; or the promoters have not had an architect amongst them, and have relied upon their own judgment. If they have "put out the design to competition" in a fine chivalrous way, we need scarcely say they have in all probability had to encounter expressly the usual consequences of chivalrous behaviour in prosaic affairs; but that is not the point. What we have to indicate once more is that, of all promoterships in building undertakings, the best is that of a thoroughly experienced professional speculation architect.

One point which particularly interests the professional world is the question how this clever agent gets remunerated for the very great trouble he has to take, and the still greater responsibility which, if only indirectly, is practically involved. We apprehend the answer is that he generally receives no special payment for his special services, but is remunerated sufficiently by the circumstance that an outlay of large amount produces a commission of large amount. It also happens usually that, when once the enterprise is fairly started, and the building operations come to be realised, the proper architectural work is much less than usual. Architects well know

the effect of what is called "repetition"; and in all buildings of the class before us repetition is commonly very prevalent indeed. We should be sorry, at any rate, to suppose that the speculation architect of high standing performs the speculative part of the business for nothing except the securing of a customer.

We are inclined to think the speculation architect is becoming more common every day, in pursuance of the natural laws that govern modern business. To this the public will not at all object, provided he makes himself well acquainted with the hazardous business he undertakes for them.

FRENCH WORK AT THE DUDLEY GALLERY.

THE agents who select French pictures for exhibitions in this country are careful to avoid all works which are much opposed to English notions of art. In consequence of this restriction, a great many artists who have gained reputations in France, including notabilities who belong to the latest developments of the French schools, are unknown among us. A few French painters and sculptors who may be said to represent a phase of art which has not been patronised in England, have tried the experiment of exhibiting a small collection of their works in the Dudley Gallery. The exhibitors are MM. BARILLOT, BESNARD, CAZIN, DAMOYE, FLAMENG, GERVEX, LANSON, LEROLLE, RENAN, RODIN, and ROLL, with two ladies, Madame BESNARD and Madame CAZIN. Several of the works which they exhibit in Piccadilly have been already seen in Paris, where it must be acknowledged they looked better. The colours, and particularly those of the landscapes, are apparently duller than when we saw them before. The wall space in the Dudley Gallery is not adapted for the exhibition of large paintings. Such a work as M. BESNARD'S *Abundance encouraging Labour* would require one side of the room to itself, and there are many pictures which cannot be seen at sufficient distance to be judged properly. In fact the works are shown under many disadvantages, and this fact should not be forgotten by visitors to the gallery. It was apparently intended that French landscape art, as well as figure painting, should be well represented, and the co-operation of one of the leaders among French landscapists was secured. We refer to M. CAZIN. His style is so marked that it is supposed to be adapted to works which are entirely decorative. But by some fatality, although his name appears prominently in the catalogue, the Dudley Exhibition has only one small sketch by him, *The Death Chamber of the late M. Gambetta* (39). The landscapes that are to be seen are, in fact, the work of figure painters. In hanging the works the French desire for equality has been recognised. All the exhibitors are supposed to be on an equality, and the visitor must determine for himself their relative worth. As much as possible an artist's works have been kept together, an arrangement that has many advantages when a painter attempts more than one kind of work. The alphabetical order has also been followed in the catalogue, but it is not necessary for us to adopt it here.

M. ROLL is an artist who has had to endure the attacks of critics for the defects which are supposed to exist in his friends' works as well as in his own. It must be allowed that there is some reason in assigning to him so large a measure of responsibility, for a great many of the younger artists of France, however diverse from his may be their styles, look up to M. ROLL as the strong man of their party. He has undoubted claims to that position. M. ROLL might be said to be an artist who is indifferent to everything that has been done in painting prior to his own time, and to the canons of æsthetics which have been derived from the works of men who are no longer living. Knowing nothing personally of Greek heroes, or of the heroic and handsome personages depicted by the great masters of the Renaissance, he has declined to construct imaginary figures according to those ideals. He substitutes for them the ordinary men and women that are to be seen in France, and especially in Paris, clothed in whatever costume may happen to be the fashion. But, as if he believed that the so-called respectable classes have little of the reality or the ugliness about them which he admires as a painter, or that proletarians are the peculiar product of our time, M. ROLL is fond of seeking his subjects among the lower strata of society. He is not, however, an illustrator of the annals of the poor like FAED or ISRAELS. Those painters have sympathy with their subjects, or they are able to paint as if they

had. But in all the works of M. ROLL which we have studied, we have seen nothing which suggested that when he painted poverty or deformity he had any pity for the sufferers. M. ISRAELS, when he represents the poor of the village waiting for the *débris* of the fisher-boat, or an old woman endeavouring to mend nets for a living, becomes as pathetic as DICKENS. But it is impossible to tell whether M. ROLL regards life as a tragedy, a comedy, a puppet-show, or a panorama. He will represent (to take his picture of last year) as much of a Paris fête as the space at his command will allow, when the figures are life-size. Nothing is set down in malice and nothing is extenuated, but somehow there will be a character about the work as if the painter were a professor of pessimism, and was desirous to make it known how strange-looking are the creatures which are the outcome of the highest civilisation in the nineteenth century. In the Dudley Gallery there is a life-size figure of a building labourer by M. ROLL, which, without exaggeration, may be said to be more accurate than a photograph. The set of the shoulders, the strong but clumsy hands, the irregular development of the frame, the very expression of the face, are so characteristic that the white blouse and lime-stained trousers of the man, and the materials about, seem almost to be unnecessary additions. But, if we recall to memory the *Stone Breaker*, which was painted some years ago by Mr. WALLIS, and contrast the idea of that picture with M. ROLL'S work, the contrast between the two styles of art will be apparent. M. ROLL'S labourer may be the more true, but there is as little "heart" about it as if it were a copy from life for the use of a student of anthropology. Differing in character are *The Old Quarryman* and the *Anzin Miner* in the Dudley Gallery, but they, too, are typical examples which the scientific inquirer may accept with confidence, and employ to illustrate his theory of the influence of particular employments in modifying the human frame. M. ROLL draws the horse as he does men, aiming to be true, but apparently without a thought of art; and the white horse in *The Meal*, who is eating green grass thrown at the foot of a blue post, and the three in the *Stable Yard* are represented as they were seen. The study at the miners' village of Anzin (18) (from which a few years ago M. ROLL took the subject of his large picture of the strike), the rough clayey top of the cliffs (19), the dark trees in the by-road (14), are all manifestly outdoor sketches from existing scenes. His *Rough Weather* (17) is simply the representation of a wave on a colossal scale. At first sight the most accurate description of it would seem to be the phrase that was applied to TURNER'S *Shipwreck* in 1842, "a mass of soapsuds and whitewash," although in this case there is little that is white. But we have no doubt that it is as literal a transcript of reality as M. ROLL was able to accomplish. The late G. P. CHALMERS, the Scottish artist, endeavoured to achieve a similar feat, but his wave (to which a canvas quite as large as M. ROLL'S was devoted) was one which had been dashed against the adamantine coasts of the north, and its natural colour was therefore unstained; the French painter shows a wave which is victorious in carrying off some of the soft material of a southern cliff, but to its own detriment as a piece of colour; it no longer seems a part of the ocean.

The thirteen works by M. GERVEX display the versatility that is characteristic of the younger artists of the French school. He paints portraits, landscapes, still life, everyday scenes, the nude, and scenes on the Thames, for our river has become a favourite study with many French artists. M. GERVEX is a realist, and he can make a big allegorical piece out of horse-slaughterers and coal-porters, but to the rigorous apostles of his school he must sometimes appear to be a weak member. There are occasional signs of sentiment in his works. What modern work, for example, had more pathos than the picture he once painted of a victim of the *Coup d'Etat*, a baby who has been tortured and maimed by the bayonets of French soldiers as an enemy to Imperialism? No invective of VICTOR HUGO'S could be more effective. A work of this kind might be pardoned for the sake of the cause which it upheld; but what is to be said by the realists to the *Summer* (27) in the Dudley Gallery, which is as sentimental as any of the figures by BOUVIER, which at one time were too popular in England? In it we see a girl in a light muslin dress, leaning on the handrail of steps by the seaside, and contemplating a rival, with a red umbrella, who is sitting on the sands engaged in conversation with the gay deceiver. The companion to it, *Winter*, reveals some

of the mysteries of a lady's toilet, and the false hair and other necessities of fashionable life are utilised so well, that the work is probably considered in Paris studios to atone for the feminine tenderness of *Summer*. M. GERVEX, if we may judge by the study of *An Abattoir* (31), departed in his student days from the usual course marked out for a painter. But even more morbid is another early work, the *Autopsy Room of the Ancient Hôtel Dieu* (22), where the shadows of the vaulting have a weird effect, through which the corpse on the table appears like a statue of stone. Very different in style, and therefore better adapted to English taste, are the two heads of girls, *Eddie* (30), and *An Outdoor Study*, in which there is more beauty than is common in works of the school. *The First Communion* (43) in a Paris church is a study of muslin and carpets rather than of girls' faces, some of which are almost "Impressionist" in haziness. The columns about the altar are of a bluish marble, and, to be in harmony, the servitor who stands near them wears a blue robe. M. GERVEX has one nude figure, *The Bath* (20), which is rather small in scale, and in work of this class he is always successful, although it was not considered advisable to bring more than a single example to Piccadilly.

The paintings of oxen by M. BARILLOT are good. In his *Wounded Duck* (63) the artist has taken a subject that has been often treated, but in this case there is no contrast with ducks who have escaped the fowler. M. BARILLOT has also tried his hand at a landscape. His *Calm Sea* (60) is a mingling of clouds and water. M. LEROLLE'S *Misty Morning* (59) represents peasants filling a sack with potatoes in a field. His *Evening and Waiting*—the latter a girl watching in a boat on a river—are two splendid works. It is difficult to say whether M. DAMOYE is better in figures or in landscape. *The Fog Effect* (2) is unlike anything with which we are acquainted in England. *The Seine at St. Denis* (5), the *View of Etaples* (7), and the *Isle of St. Denis* (3) are probably the most interesting landscape pieces in the gallery, while his *Shrimpers* (8) is almost like a work of COROT'S.

M. BESNARD has evidently been eager to demonstrate the variety of work he is competent to undertake. His *Abundance encouraging Labour* (36) is of colossal size. The portrait of *Lord Wolseley* (53) is not according to our English notions; there is far too much display about the fiery charger on which the general is leaning, and the background is of indefinable kind, as if it were matter charged with thunder and lightning. In the portrait of *Sir Henry Green* (12) M. BESNARD, like all French painters with the exception of M. DETAILLE, has failed to catch the tone of the army scarlet. The portrait of *Mlle. G.* sustains the artist's reputation, and in *The Birth* there is more tenderness than is generally found in modern works of the school. Madame CAZIN has a few good monochromes—*Studying* (38) might pass for the work of an old master.

M. FLAMENG paints ships with great breadth, although there may not be in his pictures the familiarity with details which was seen in CLARKSON STANFIELD'S works, and he throws his sails about the yards in a fashion that would make an English sailor stare. His *Three-master Going Out to Sea, Havre* (49) is, we think, the best among his ten works. The blocks for hoisting sails in a ship have a peculiar fascination for M. FLAMENG, and in some of his small pictures they assume an importance which is irregular. This produces a spotty appearance, and so accustomed is the artist to spottiness that it appears in his landscapes, such as the *Low Tide at Morsaline*.

There is no artist represented in the gallery whose position is more difficult to define than that of M. ARY RENAN. He was a pupil of M. PUVIS DE CHAVANNES, and has acquired at least much of his master's disregard of prescribed arrangements. M. RENAN will never be a popular artist, unless some French RUSKIN can be found who will devote himself to the elucidation of the artist's pictures. With M. RENAN the idea is everything. Having evolved a subject, he is satisfied with recording it in a form that he himself will understand, although to the public it may be as obscure as a collection of hieroglyphics. If M. RENAN were filled with an ambition to rival DÜRER'S *White Horse* and the *Knight and Death*, in affording subjects for speculation, he could hardly be more mysterious. The meaning of most of his pictures is beyond the comprehension of the visitors to the Dudley Gallery; perhaps there are some which now would be a puzzle to the artist. *The Lady of the Lake*, for example; who is she? We see her sitting apparently as forsaken as PRADIER'S *Sappho*. She is clad in a painfully-bright emerald green robe, and her companion is

a bird, the blue of the feathers being as "loud," to use a slang term, as the green. In another picture a female no less mysterious contemplates a swamp, and is entitled *Recollections of Venice*; and in a third sketch a woman leans against a door and becomes *The Poetry of Ruins*. Fifty different guesses might be offered as to the meaning of those things. Two sketches are taken from the story of ORPHEUS, and that in which he is seen leaning against a tree is expressive of deep grief, although neither man nor tree belongs to this world. *The Flight into Egypt* has the materials for a fine picture. The Holy Family have been heretofore represented travelling on roads, over sands, and crossing streams by night and by day, alone and attended by angels; but in M. RENAN'S picture a marsh is seen, in which the wanderers are nearly submerged. The risks of the journey are consequently more plainly suggested in this new version. *The Plain of Troy* may have been taken from nature, and it corresponds in character with the descriptions of more than one of the suggested sites in having a very narrow stream to serve for the Scamander, tumuli, and a dreary aspect. The details are put on the canvas in a matter-of-fact way, without any attempt to give interest to the scene by the introduction of figures or atmospheric effects. M. RENAN is evidently of opinion that the smallest canvas is sufficient to express an idea. In his *Diver* only has he used one that is as large as an average engraving, and we are compelled to say that in it the defects of his figure-drawing are more apparent. The woman to whom the flowers from below are brought is as characterless as a ship's figure-head, and the diver is like a ghost.

There are people who maintain that the French are more successful in sculpture than in painting, and the statues and busts in the Dudley Gallery are undoubtedly excellent examples. Those by M. RODIN are by themselves of sufficient value to repay a visit. His bust of *M. Laurens* is a masterpiece; the likeness is unmistakable, and suggests the vigorous painter who finds congenial subjects among Merovingian scenes, and the master whose maxim is "thorough," and in whose ateliers there is no playing with art. In the bust of M. RODIN'S former master, *M. Carrier-Belleuse*, the art director of the Sevres factory, we have a type of a different and a more genial idiosyncrasy—a man to whom a Greek statue is more than all the histories of THIERRY or SISMONDI; but the likeness is no less true to nature. Both busts were exhibited in last year's Salon. The plaster statue of *St. John-Baptist* is a vigorous work, although it is not in accordance with the ordinary treatment. It is a finely-modelled nude figure, the countenance being expressive of a man who is in earnest when preaching. Madame BESNARD has four works in various styles. *Judith Showing the Head of Holofernes* is in bronze, and marked by dramatic vigour, and forms a contrast to the marble *Jephtha's Daughter Grieving on the Mountain*. There is a bust of *Mr. Stanley*, the African explorer, and a colossal terra-cotta relief, *Melancholy*. M. LANSON has some good busts, but his bronze bas-reliefs are probably more interesting. In one the strange legend of Salammbo is represented.

From what we have said it will be evident that there are several departments of painting which are without examples in the Gallery, especially historical works and decorative figures. But what is seen will suggest some of the principles by which modern artists in France are guided.

THE HYGIENIC EXHIBITION.

THE formal opening of the exhibition promoted by the National Health Society took place on Saturday last, at Humphreys' Hall, Knightsbridge. One of the objects of the exhibition, as explained on that occasion, is to forward the aims of the Society in endeavouring to promote the application, in the homes of all classes of society, of the great principles of health, which are now better understood than in past times. In this respect the exhibition is of tolerably extended scope, and embraces articles of costume and clothing, products of food and drink, house sanitation and hygienic decoration, appliances for the sick room and home nursing, apparatus and appliances for heating, lighting, ventilation, cooking, &c. Hygiene for the cottage and the industrial dwelling has also a class to itself, in which attention has been given, among other matters, to cheap damp-proof walls, roof coverings and damp-proof floors, models and plans of flats and cottages for the

artisan classes being shown. Thus the exhibition, though branching off in many various directions, has a special connection with all that concerns building operations in their various stages, and it is needless to say that the principal exhibitors in these matters are already well known to our readers, though a short note of some of the exhibits may be of interest.

No one visiting the exhibition will fail to see the substantial monuments of the inventive skill of Messrs. ROBERT BOYLE & Co., of Holborn Viaduct and Glasgow. It is hardly necessary to direct attention to the ventilators, plain and ornamental, the self-acting air-pump ventilators, &c.; that they are efficient for their purpose is all that is necessary. There is a model and plan of BOYLE'S complete economical system of ventilation for workmen's cottages, which system has been awarded gold and silver medals and other high awards in the past two years. The adaptation of vertical inlet tubes to suit the internal decoration of higher-class dwellings, will also be noticed. A pamphlet, giving a complete description of the ventilation of the Guildhall, London, which appeared in *The Architect*, may be had of the attendant in charge of the stall. The principles of Messrs. BOYLE'S system will be found fully explained therein.

Mr. T. HARCOURT THOMPSON, of Victoria Buildings, Deansgate, Manchester, shows a patent which, while actually a building material to be incorporated in the finished house, serves the hygienic purpose of a ventilator, and is called the Patent Ventilating Ridge Tile. There is a section of a house to show a complete system of ventilation by exhaustion through the ridge tile. All parts of the house are connected with the roof by air-flues, constituting a permanent means of ventilation that will last as long as the building itself, and cannot get out of order. The tiles are red terra-cotta and blue Staffordshire, to be had in any required design. It claims attention from its cheapness as compared with the use of non-effective appliances, and its independence of circumstances of wind and weather; moreover, it can be readily applied not only to new but to old houses.

The patent pavement, area, and floor-lights of Messrs. HAYWARD BROTHERS & ECKSTEIN, of Union Street, Borough, will be noticed, though a visit for this purpose to the exhibition is hardly needed by those who walk through the London streets. Pedestrians cannot take many steps without encountering the iron plates that indicate the legion of coal-cellars below the pavements. If these cannot be dispensed with, Messrs. HAYWARD BROS. have at least the credit of rendering them innocuous as far as tripping up or maiming the pedestrian is concerned, by offering an improved safety coal-plate, described as illuminating, ventilating, or solid iron with rings for asphalt or stone paving. Messrs. HAYWARD'S Sheringham ventilators for the admission of fresh air through an external wall without creating draughts—inlet and outlet ventilators—the foul air being carried off from the apartment by the smoke flue, have been lately noticed in *The Architect* at a previous exhibition.

Messrs. EDGAR ALDOUS & SONS' (Queen's Road, Peckham), hot and foul air extractors are applicable to buildings large and small, schools, churches, houses, stables, &c., to ships' cabins and to railway carriages. The objection to extractors that are open to all the winds that blow is here no objection, rather the reverse. From whatever quarter the wind may come, the air enters. The apparatus is described as consisting of two concentric shafts. Between the inner and outer shafts is a space for foul air to pass upwards. In the inner shaft is a conical bottom, and directly above are apertures for the wind to escape into the outer shaft. The head receives the wind when blowing from any point and takes it into a concentrating tube set into the inner concentric shaft, whence it travels down and round the conical bottom, makes its way through the apertures in the inner shaft into the outer shaft, converts itself into an up current, and forces the foul air from between the two concentric shafts up to the top and out of the escape—in other words, the down draught is converted into an up current. As a thorough means of house ventilation while purifying the air, it prevents dust or fog entering the rooms along with the air, counteracts the risk of gas explosions, and is effective for sewer, gas, or water-closet pipes.

Messrs. HAYWARD TYLER & Co.'s (Upper Whitecross Street) specialties have been described in these columns quite lately. The present occasion, however, affords a good opportunity for inspection of their full-flush valveless closet with syphon cistern; elastic valve closets; baths and fittings;

urinal fittings; hydrants, valves, and stand-pipes; lavatory fittings, shower and douche valves, &c.

A handsome lavatory—improved tip-up and lift-out system—the patent of Mr. GEORGE JENNINGS, of Palace Wharf, Stangate, Lambeth, should prove an enticing article for investment in the summer weather that the metropolis has lately been favoured with. It is furnished with hot and cold shampooing valves, and as water is laid on, it can be seen at work; so also can the full flush of water in connection with the patent water-closets, the earthenware valve water-closet trapped in one piece, the earthenware trapless valve water-closet, Bramah valve-closet, &c., as also the automatic flush for urinals, which can be timed to discharge at any desired rate. Besides lavatory and closet apparatus—and among these are a portable water-closet in mahogany case—may be seen various specialties of Mr. JENNINGS in the shape of butler's and housemaid's sinks and wash-ups, the enamelled slate automatic flushing cisterns, ball traps for bath and lavatory waste-pipes, glazed stoneware, ventilating drain-traps, grease-traps, tidal-traps, &c.

It would have seemed rather out of place in a hygienic exhibition, if MOULE'S Patent Earth-closet Company had not put in an appearance. They are, however, represented at the present exhibition. The ordinary apparatus and its method of working can be seen, as also more elaborately got-up closets, suited to meet the taste or means of different classes of purchasers; commodes in plain deal with common fittings, the same in panelled teak with superior fittings. Models show a closet constructed so that the hopper may be filled with earth and the receptacle emptied from behind, and without the necessity of entering the closet, and mode of filling and emptying an upstairs closet from the ground floor by which carrying the earth up or down is avoided, as also the entry into the house of the attendant.

The sanitary appliances of Mr. HENRY CONOLLY have been pretty fully described before in *The Architect*. The patent valve-closet is exhibited, in which the overflow area is always flushed, and the trap sealed every time the closet is used; the valve-closet, in which the basin is trapped in itself, and cannot be syphoned; the noiseless water-waste preventor and wash-out closet, &c. There are also the Acme needle and spray-bath, batchelor's bath, &c., slop-sinks and sanitary earthenware. In the valve-closet above mentioned the trap is always sealed, so long as there is any supply of water to cause an after flush, however small; it is so designed that, although trapped, it cannot be syphoned, nor can the overflow-pipe get stopped-up, as the overflow of most valve-closets is liable to do. It is, moreover, self-cleansing, and each time the closet is used the water in the overflow is entirely changed, without the use of a weeping-pipe or other auxiliary. The "Acme" spray or needle bath, with shower and douche combined, is so arranged that either a hot, tepid, or cold full-length plunge bath, or a hot, tepid, or cold shower, needle, or douche bath can be used, as desired. The several baths are worked by the valves, and the temperature of the water can be regulated to suit the bather.

Messrs. HODKINSON & CLARK, of Small Heath, Birmingham, whose exhibits at the Building Exhibition will be remembered, have on view a specimen of the convertible school desk and seat, which is, from a health point of view and suitability for purpose, all that can be desired, and the pupil who uses it is not likely to be hampered in his studies by being forced into strained or painful postures.

Conspicuous among the exhibits of the Coalbrookdale Company, Limited, Holborn Viaduct, &c., are decorated iron mantelpieces and over-mantels, which have been described before in these columns, and which cannot fail to attract attention. A "Kyrle" grate to which a silver medal was awarded at the Smoke Abatement Exhibition, fitted in a decorated iron mantelpiece, with fender, &c., complete, various other grates—Save All, Premier stove, nursery grate, &c.—will be noticed.

Space precludes our entering now on several exhibits which we hope to refer to by-and-by. It may be mentioned that among other firms represented occur the names of Messrs. KITE & Co., R. ADAMS, C. HINDLEY & SONS, WOOLLAMS & Co., BEYNON & COX, UNDERHILL & Co., Victoria Stone Company, Albissima Paint Company, Silicated Carbon Filter Company, &c.

The Dominican Church in the Faubourg St. Honoré, Paris, was sold on May 30, for the sum of 41,200*l*.

PARIS NOTES.

THE eleventh annual Congress of French architects will be held during next week at the Ecole des Beaux-Arts, under the presidency of M. Bailly, Commander of the Légion of Honour and member of the Institute. The programme of the Congress is an extremely interesting one. The number of visits to be paid by the meeting as a body to buildings in course of erection or completion is considerably larger than usual, and will include an inspection of the Hôtel des Postes, the Nanterre Reformatory and Prison, M. Parvillée's Ceramic Manufactory, the Château de Pierrefonds, and the Hôtel de Ville. The list of papers to be read comprises—"Architecture at the Salon," by M. Tournade; "L'Arc d'Orange" (the Orange Triumphal Arch), an account of the work done at Orange since Caristie in connection with the famous Gallo-Roman remains, by M. E. Desjardins, member of the Académie des Inscriptions et Belles-Lettres; "Ceramics," by M. Deslignières; "Architects' Fees," by M. Dormay; and "Recent Excavations at Sanxay," by M. Corroyer. The Congress will be brought to a close on Saturday by the proclamation of the laureats for the year, on which occasion M. Durand, Under-Secretary of State for Public Instruction and Fine Arts, will preside.

The Conseil Supérieur des Beaux-Arts have met at the Palais de l'Industrie, and, after a careful inspection of the works of art on view have (as was predicted in *The Architect* on the opening of the exhibition) awarded the Prix du Salon to M. Georges Rochegrosse, for his fine painting *Andromaque*. M. Rochegrosse, who has already received a second-class medal by the votes of the exhibitors themselves, is a native of Versailles, and studied under Messrs. J. Lefebvre and Boulanger. He is still very young—in his 24th year—and in 1882 gained a third-class medal for his picture *Vitellius*. In a first ballot on Saturday last he obtained 16 votes against 9 given to M. Michel, 5 to M. Henri Martin, 1 to M. Palley, and 4 blank papers. In a second round the result was—M. Michel, 16; M. Rochegrosse, 15, and 4 blanks. As, however, the former had not succeeded in obtaining an absolute majority of the votes cast, a third ballot was necessary, in which M. Rochegrosse secured 17 against 16 cast for M. Martin, sculptor and author of the fine group *L'Aveugle et le Paralytique*, exhibited at this year's Salon.

Of the ten Bourses de Voyage, or travelling prizes, at the disposal of the Council, it was decided to allot five to sculptors, three to architects, and two to painters, and the following young artists were chosen: Sculptors—MM. Michel by 30 votes, Carles by 24, Desca by 23, Pallez by 17, and Lombard by 17; Architects—MM. Courtois-Suffit, Ruy, and Larche; Painters—MM. Margin and Bérout. Finally, the Council named a special committee of its members, charged to see that the money thus distributed to promising artists, with a view to enabling them to travel and study the old masters in Italy, Germany, and other countries, is really devoted to this purpose by the recipients.

The yearly exhibition of works of painting and sculpture sent by the pupils of the French Academy in Rome, will open on the 15th inst., at the Ecole des Beaux-Arts on the Quai Malaquais. The pupils of this Institution have of late been very successful, having won during the past year two great musical prizes in Paris, the highest rewards in sculpture at the Salon, and the first award in the competition for the Italian memorial to Victor Emmanuel, in which M. Nenot proved victorious against some 2,000 other architects and sculptors who forwarded designs. The last yearly exhibition showed some good work in every department, and more particularly in that of architectural design.

The Director of the Academy is selected from three candidates by the President of the Republic, for a term of six years, and has to send in to the French Government an annual report upon the work of each pupil. Extracts from this report are published in the *Journal Officiel*, but in its original shape it is of a confidential nature and not accessible to the public. The students consist of young artists that have gained the Grand Prix de Rome in painting, sculpture, copper-plate engraving, medallion and stone engraving, and music. They are pensioned by the State for four years, provided they remain unmarried, receiving an annual sum of 3,510 frs. each, in addition to 600 frs. travelling expenses from Paris to Rome on arrival, a like sum on their final departure, and a yearly allowance to pay the expenses of their work.

Students in architecture proceeding to Athens, where there is a sister institution, receive 800 frs. expenses. When travelling

for the sake of instruction, further allowances, varying according to circumstances, are made. There is a library and museum of casts attached to the Academy at Rome, the members having also free admission to all the museums, galleries, and monuments of the city, and the use of a living model, who sits for two hours every day.

Each student of painting must during his first year execute a figure subject from nature, a two-figure drawing after some great master, and a sketch of some noted statue or bas-relief; in his second year, a picture of at least two nude or semi-nude figures, life size; and in his third year a copy of some well-known painting or fresco by an old master, full size, to become Government property, and a sketch of his own composition. Finally, in the fourth and last year he must send to Paris a figure painting of his own design. A similar course of work is expected from all the other students, each in his department.

A deputation, including several members of the French Chambers, waited upon the Minister of Commerce on Monday last for the purpose of proposing the organisation of a National Exhibition in Paris during 1885, which would serve as a sort of prelude or introduction to the Grand International Exhibition to be held in 1889 in celebration of the centenary of the Great Revolution. M. Hérissou promised to lay the matter before the Council of Ministers.

A French paper publishes an interesting list of the decorations bestowed upon native and foreign artists at the various exhibitions held in Paris during the past twenty years. The total number of French artists who have received the Legion of Honour is 450, divided as follows: 216 painters, of whom 171 knights, 39 officers, 5 commanders (MM. Baudry, Bonnat, Gérôme, Hébert, Robert Fleury), and 1 grand officer (M. Meissonier); 82 sculptors, of whom 66 knights, 13 officers, 2 commanders (MM. Dumont and Guillaume), and 1 grand officer (M. de Nieuwerkerke); 122 architects, of whom 122 knights, 18 officers and 2 commanders (MM. Bailly and Boeswillwald); 30 engravers, of whom 28 knights, 1 officer, and 1 commander (M. Henriquet). Of foreign painters 66 have been decorated, of whom 54 knights, 10 officers, and 2 commanders (MM. de Madrazo, Spain, and Stevens, Belgium); of foreign sculptors there are 11 knights and 2 officers; of architects, 8 knights and 1 officer; of engravers, 2 knights and 1 officer. Only one lady artist has received the coveted ribbon—Mlle. Rosa Bonheur.

Some well-known works of art were disposed of in the sale of M. Raymond Sabatier's collection at the Hôtel des Ventes. Among them were Decamp's *Albanian Soldiers at the Door of a Prison*, which fetched 10,000 frs.; Delacroix's *Rape of Rebecca*, 51,000 frs.; *Two Lions at a Spring*, by the same, 15,100 frs.; *Magdalene at the House of Simon the Pharisee*, 20,150 frs.; *The Lizard*, by Diaz, 17,000 frs.; *Pasturage near the Oise*, by Jules Dupré, 22,000 frs.; Ziem's *Golden Horn*, 10,000 frs.; *Le Juge ou la Cruche Cassée*, by Debucourt, 11,000 frs.; Drouais' portrait of the young *Duc de Choiseul*, 13,100 frs.; *A Quay on the Marne*, 7,000 frs.; Prudhon's *Minerva leading the Genius of Art to the Abode of Immortality*, 9,000 frs.; Tenier's *Chapeau Blanc*, 12,000 frs. Two pieces of sculpture, by Clésinger, were also sold—*Woman Stung by a Serpent*, 20,300 frs.; and *Hélène*, 11,900 frs. The total of the day's sale amounted to 411,230 frs.

The Exhibition of Portraits of Celebrities of the past century was unfortunately obliged to close on Tuesday, the 5th inst., the galleries it occupied at the Ecole des Beaux-Arts being required for the exhibition of works sent from the French Academy at Rome, which is to open on the 15th. So popular has been this exhibition of the portrait-painter's art, that the management find themselves in a position to hand over about 100,000 frs. to the "Fund for Establishing Night Refuges in Paris," on behalf of which it was got up.

On Tuesday, the 12th inst., an interesting exhibition will be opened at the Georges Petit Gallery in the Rue de Sèze. It is to consist exclusively of acknowledged masterpieces lent by private collectors, and the management announce that they have succeeded in getting together about a hundred remarkable works by the old and modern masters. The proceeds of the exhibition will be handed over to the "Fund for Endowing Free Schools."

Freemasons' Hall is to be rebuilt on an enlarged scale, in order to hold an assembly of fifteen hundred. The work will need an outlay of over 30,000*l.*, in addition to the sums which will be paid by the assurance companies.

THE RELATIVE CLAIMS OF ETCHING AND ENGRAVING TO RANK AS FINE ARTS.*

BY F. SEYMOUR HADEN, F.R.C.S.

IT is to be understood, for the purposes of the present short paper, that all forms of engraving on metal, whether by the etching-needle, the burin, by mezzotint or aquatint, or by whatever other form the artist may choose as a means of original expression, are to be considered as included in the common term etching; and that like forms, when not used for the purposes of original expression, are to be understood as included in the common term "engraving."

Thus it will be seen that the object of the paper is not to contrast etching as a process with engraving as a process, the etched line with the engraved line, and to say of one that it is better as a form of art expression than the other, and certainly not, in any sense that can be considered in the least personal, to exalt one class of artist at the expense of another; but to compare, without regard to the process employed or the person employing it, the practice of the painter-etcher, who is an original artist, with that of the modern engraver, who is not an original artist, and, by the discussion which I hope will follow such comparison, to arrive at an intelligible conclusion as to the comparative claims of the two to be considered a "fine art."

Nor can such an inquiry be considered any longer as in any sense either impertinent or unnecessary, since etching, though an original art with a great history, is without representation in the Royal Academy; while engraving, which is not an original art, is fully represented there, and since without such good representation (such is the influence, for good or for evil, which attaches to the action of the Royal Academy, and such the irresponsible power vested in that body): that no art, however legitimate, can live among us, and no artist, however meritorious, thrive. I think it proper to say at once that it is an object of this paper not merely to suggest an interesting inquiry, but to test the reasonableness of this position.

Before such a comparison can be made, however, it is obvious that a consensus of opinion must first be established as to the nature of the conditions which constitute an art, and as to the principles which regulate and control such conditions, and also as to the nature of those special conditions which elevate an art, properly so-called, to the rank and dignity of a fine art.

It would be difficult, perhaps, to find any word of the same dimensions which, in its various applications, covers so much disputable ground, and as to the precise logical value of which so much confusion exists, as this little word "art"; for art in the abstract is not art in the concrete; nor are "art" and "the arts" the same thing; while there is a point at which that which may properly be called an "art," and that which is only an "industry," may well be matter of opinion.

This being so, the shortest, and perhaps the only, way to re-establish the order of ideas the confusion of which is here recognised, and to determine what art is, is to determine, in the first place, what it is not. Thus art, it may be advanced as a negative hypothesis, is not manufacture; is the reverse, that is to say, of manufacture. The "*arts et metiers*" of the French, and the "arts and manufactures" of the English, are statements of the antithesis here implied; and though neither term is used correctly, since *metier* means mystery or mastery, and is applicable to an art as well as to an industry, and manufacture means something made by the hand, while we understand it as a product of the loom, still, as embodying a well-defined distinction consecrated by usage, the expression, especially in this place, may well be allowed.

In what, then, it may be asked, does an art differ from a manufacture? An art differs from a manufacture in this, that, though it depends on agencies of a material kind for its outward expression, still those agencies, like the brush of the painter, are of a simple kind, and are wholly directed by an impulse which has its seat and centre in the brain of the artist. Invest any one of those simple agencies—the brush of the painter, the pencil of the designer, the chisel of the sculptor, the needle of the etcher, the knife of the surgeon, the pen of the poet—invest, I say, any one of these simple agents with any of the properties of the machine—render them, that is to say, in any degree automatic, so as to make unnecessary and place in abeyance the brain impulse just spoken of—and you will have, as a result of such agency, not an art but a manufacture. Or, it may be, by a sort of marriage of the two conditions, there may result something which is less than an art and more than a manufacture—that thing of modern birth, in short, which has come to be called an "art manufacture." I see no objection to this term, since, by the infusion of an art element into it, even a tombstone may be made a work of art, as in the time of the Romans, and a *pot au feu*, as in that of the Etruscans.

A principle of an art, again, is that condition, or one of those conditions, which, by common consent, is admitted to be necessary to its healthy existence.

If, therefore, art is the brain impulse which it is here assumed to be, and this reading of it is confirmed by Johnson when he

declares it to be something which is not taught, it clearly follows that the first great fundamental principle of art must be personality—originality; out of which, again, come ideality, invention, sensibility to external impressions of form, colour, and composition, which is a sense of the beautiful, passion, poetry, and whatever else the mind of the artist is capable of. Not that the practice, and even a certain proficiency, in special branches of art suppose the possession, as of necessity, of all these great qualities; one of them, however, I venture to affirm is necessary, and that one is originality.

It is only necessary to apply this principle to the practice of the older and the modern engraver, to determine the essential difference between the two, and, as it happens, this difference is also susceptible of demonstration. If, for the purpose of such demonstration, I take therefore some well-known engraving, some generally accepted example of the perfection of the engraver's art, such, say, as Sharp's engraving of Sir Joshua Reynolds' *Holy Family*, and some equally well-known etching, such as Rembrandt's *Three Trees*, Durer's *Erasmus*, or Vandyck's *Vostermans*, and project upon a screen analogous portions of them, so as to contrast, say, the foreground of one with the foreground of the other, the drapery of one with the drapery of the other, the flesh of one with the flesh of the other; such demonstration will, I think, plainly show that, while the etcher, under the influence of brain impulse and in the full exercise of his volition, engraved as he felt, and allowed himself as he did so the utmost latitude and variety of expression, the engraver, animated by no such impulse and deprived of his volition, has been driven to express himself by signs and formulæ which as art expressions have no intelligible meaning. I might, of course, have found for the purpose of this comparison modern engravings and modern etchings which would have furnished even a more striking contrast of the difference of practice here referred to; that I have not done so will be at once understood. If, also, I show engravers' work first, it is because—in order that the technical difference between the two may be seen—I must take as a standard of the comparison that one of the two with which the greatest number of persons are most familiar, and that one happens to be engraving.

Here, then, for instance, is the engraver's formula for foreground. It is not, as you see, in the least like foreground, or anything which commonly enters into the composition of a natural foreground; and yet it is the pattern—I can think of no other term—which is used for foreground in nine engravings out of ten, I might almost say of nine hundred and ninety-nine out of a thousand. If the engraver had had the least idea of a foreground in his mind he surely could not have done it; that he did do it may, I think, be taken as a proof that he had no such idea; in other words, that the mind had no active part in its production. Contrast this now with an equal portion of foreground taken from an etching by Rembrandt. It is, indeed, but an indication, yet every stroke of it proves that the ordinary components of a landscape foreground, grasses, rushes, and even flowers, were present to the mind of the artist as he did them; that his intelligence, that is to say, was awake, his sense of beauty excited, and that both were in active use as a means to the end he intended. In the case of the engraver there is no sign of any such mental activity, and therefore, as a result, no art.

Here, again, is this formula by which, as a rule, the engraver expresses flesh. It is still more curious. It consists, as you see, of a number of curved lines parallel to each other, and drawn in the sense of the contour of the object which they are intended to represent, each line being broken into short segmental portions of equal length with a well-defined dot between every two. That object happens to be part of the cheek of the Virgin. The shadow which determines the rotundity of the part is produced, you see, not by any attempt at drawing, such as an artist would have used, but simply by a thickening or thinning of the line, and an enlargement or lessening of the dot, as the case may be; while the moderate lights are determined by their sparseness, and the highest by their total omission. Take, now, an etched head of Rembrandt, of himself; the planes of the face, it will be seen, are expressed, not by any sort of formula, but by the same power of simple drawing which distinguishes the rest of the head, while the accuracy of the drawing is vouched for by the fact that it suffers nothing by an enlargement of from 1 inch, which is the size of the etching, to 15 feet or thereabouts. Vandyck, in his own head, and in that of *Vostermans*, obtains his end in the same simple fashion, while in the *Pontius* may be seen the vigour and learning of the etcher subdued and corrected—sweetened is the technical term—by the engraver.

Drapery, again, is suggested by lines of unequal thickness, one being very thick, and the next one very thin, in wavy parallelism, and also in the direction of the contour of the folds; the planes being suggested by a few cross strokes here and there; the same pattern as before being in constant use. With the painter-engraver, on the contrary, who in this case happens to be Durer, every fold is a labour of love, and is made out by work which suggests nothing but what it is meant to be. Moreover, the work is like himself—like Durer, and nobody else.

Engraver's stems, trees, and foliage are subject to the same observation, whereas the etcher does his best to give not merely

* A paper read before the Society of Arts on May 30.

the fact but, without being in the least servile, the rugosities of the bark and the whole behaviour of the tree. The example here shown, which is one out of three trees in Rembrandt's etching of that name, is in the original etching exactly an inch and a half high. Here it is fifteen feet or more, and yet it loses nothing, but rather gains by the enlargement; and this reminds me to say, in deference to an objection that has been taken that the enlargements here shown have not, in every case, been made by the photographer on exactly the same scale, that such exception is without force, the enlargement being simply made that the technique of the work may be seen at a distance; unless, indeed, which is true, that the more you see of an unintelligent line the less intelligible it becomes, and the more you see of an intelligent line the more intelligible—in other words, that if the engraver's line, in proportion as it is exaggerated, becomes less and less like the thing it is intended to represent, the etcher's line becomes more so.

Now, I would respectfully submit that this strange departure from all forms of natural representation on the part of the engraver, and his adoption of a set of symbols which he learnt in his apprenticeship, and which he will transmit to his successors, and which in no respect differ from the symbols employed by the heraldic engraver—in which certain lines stand for gules, certain others for argent, and others for sable—can only be explained by the fact that his task is a mechanical one, and that the brain impulse necessary to the exercise of the creative faculty, and therefore of the art faculty, is in abeyance. True, it must not be forgotten, and may in fairness be here objected, that all lines employed in art are but conventional expressions, and, since there is no such thing as a line in nature, that the line of the etcher is as conventional an expression as that of the engraver. Yes, but there is this difference between the two, viz., that the line of one is an intelligent line, an intellectual means to an intellectual end, and that the line of the other is not. And another fact which plainly grows out of this difference in the intellectuality, if I may use such a word, of the two things, and which seriously affects, of course, their relative art value, is that, while the work of the etcher has an identity of its own, so that we recognise at once an etching by Rembrandt, or an etching by Vandyck, one engraving, as a rule, is really very like another. This statement has been vehemently contested, yet it is a statement the accuracy of which anyone who possesses half a dozen engravings and half a dozen original etchings may test for himself; and the exception, moreover, when it is met with, proves the rule, for there are, or rather there have been, engravers who have not at all times, and as a matter of course, condescended to this sort of mechanism. Pontius, Bolswert, Vostermans, and the earlier reproductive engravers who followed Vandyck, were of this category, and so in fact were Nauteuil, the Drevets, Masson, and the great portrait engravers of the French school. But these men following, as they did, closely on the heels of the painter, and being not unfrequently called upon to interpret his indications, rather than copy his work, were themselves, to some extent, original artists, and as such had no need to employ, and in fact instinctively avoided, a technique which was not their own. Yet even of these, it must be said, that when not so engaged, and when engaged in copying—so soon, that is to say, as the act of interpretation ended with them, and that of translation began—they fell into exactly the same mechanism.

The differences which exist between etching and engraving may, therefore, be properly described as of two kinds—differences of principle, and differences of technique—and these again may, not inaptly, be described by some such formula as the following: "Etching, depending on brain impulse, is personal, and, the creative faculty being chiefly engaged in it, invention, sensibility, and the various attributes which make up the sum of genius, belong to it and constitute it an art." Engraving being without personality—except such as may be supposed to be evolved in the act of copying or translating the work of another—originality, and all the attributes which attend the exercise of the creative faculty, are absent from it, and constitute it a *metier*. There is, I submit, no escape from this position.

All forms of engraving, in short, whatever the processes employed in their production, divide themselves, necessarily and naturally, into two kinds—those which are original and those which are not. Those which, under the name of painter-engraving, or etching, were practised by the great masters of painting, who were their own engravers, and by means of which we are able to obtain, even in this remote day, work as original as their painting, and at a comparatively moderate cost; and those by which, under the common term of engraving, the design of the painter is reproduced upon the plate by other minds and other hands.

The workers employed in each of these two kinds of engraving are subdivisible, again, into two distinct groups: the group of painter-engravers, or etchers, who flourished with Durer and with Rembrandt, and a class of workers in the same direction and having the same art aims, which has sprung up in this country within the last thirty years; and the group of mechanical engravers which divides itself into the class of interpreters, and the class of copyists, or, as they prefer to be called, translators.

A short notice of each of these is necessary. The importance of the first of these groups, that of the painter-engravers or etchers of the older school, and which immeasurably transcends

that of the other groups, may be measured by their numerical strength and the number of their engraved works; by the great public collections of those works which have been made and are treasured in every museum in Europe; by the extent of the literature which has been devoted to their history and description; and by the keen competition which is excited for their possession when these—as we have seen recently—come into the market. It is an object of the present paper to suggest the claims which, under one or other of these heads, the group has upon the attention of the student.

Some, though, but a faint, idea of the *personnel* of this, the first of the two groups—that of the painter-engraver group—of the kind of art they practised, of the schools they formed, the countries they inhabited, and of the nature, though not of the number of the works devoted to their description (since the list here given represents but a tithe of them) may be gathered from the diagrams on the walls, the very length of which furnishes a measurable proof of their importance. Strange as it may appear—and still stranger when it is considered that, taken collectively, the etchings and engravings the *ensemble* of which here indicated represent the whole history of art at the best period of its existence—the study and enjoyment and collection of them belong almost exclusively to the amateur, a person that a distinguished academical friend of mine thinks ought to be put down. The professional artist of the day (although it was not always so, as the marks of Reynolds and Lawrence on their acquisitions indicate), as a rule, knows little about them, and cares less. For all that, a treasury of knowledge is hidden away in them, a treasury so vast and deep that if, instead of the disjointed collections which with so much labour and so little consecutive arrangement they now get together from year to year, the Academy would only open its doors to them, and make a winter exhibition of them, they might show us and themselves at a glance the whole story of art. Moreover, seeing what has been done in this direction by the fathers of engraved art, and comparing what they see with what is being done now by the favoured academical-engraver elect of the Academy, who knows but their hearts as well as their eyes might be opened, and their hands even go out to those more original engravers who, for the best part of a generation, have been doing their best to emulate the practice of their great prototypes, and who, during the whole of that time, they have been keeping at arm's length? Quite seriously, I would suggest to the Academy that it could not do better than systematise its exhibitions of the old masters by a comprehensive exhibition of their etched works, because such an exhibition, over and above the inherent interest which it would possess, would furnish an intelligent key to all future exhibitions, just as drawings and models furnish a key to the pictures of which they are the first thought. Nor would they meet with any trouble in making a catalogue of its contents, seeing that such catalogues are ready made to their hands, and without a single mistake of any consequence to disfigure them, while the diagrams on the walls would furnish them with a hint of the order which might usefully be given to such an exhibition.

Turning now to the second class of this group, the class of modern original engravers, the etchers—the pariahs of the Academy—they consist of a number of persons, some of them painters, and some of them artists seeking to make a profession out of original engraving, who, in the belief that a return to that art in its pure forms is still possible, have formed themselves into a society for its promotion. This association, under the name of the Society of Painter-Etchers, and which succeeded the old Etching Club, consists, at present, of about a hundred original engravers, who meet once a year to exhibit their works, observe progress, and comment on the ostracism to which they are being subjected by the Royal Academy. Their idea being that a return to the original form of engraving, as it was practised by the great masters of painting, would be an advantage to art, their wonder is that such an idea should meet with no encouragement in an Academy of Arts. They go even further, and think that they have a right to be represented in such an Academy, and that the present Academy, in excluding them, is not true to its mission. Another peculiarity of the Society is that, unlike the academical-engraver, who employs an assistant to carry his plates up to what is called "a first proof," its members do the whole of their plates themselves—that is to say, prepare them, think them out, execute them, and, not unfrequently even print them, to which end many of them, like the engravers of old, have printing-presses in their houses. Finally, they have no connection with any trades union such as the "Printers' Association," do not make or sell under deceitful stamps and delusive differences of lettering, false proofs, and, on the whole, go to bed at night and get up in the morning with a clear conscience.

The second group—the group of engravers who are not original artists, and whose occupation is to reproduce on their plates the designs of others—divides itself, in like manner, into two classes—the class of the extinct "interpretive" engraver, of whom I shall make special mention presently, and the class of "translator" engraver, of which the academical-engraver of the day is the type.

I am not aware that the marked deference in the art *status*

of these two classes, and the comparative rank that ought in reason to be assigned to them, has ever—except by the amateur—been observed. That difference, however, is very great. When, by the preaching of Savonarola against luxuries, and by the death of Lorenzo di Medici, painter-engraving, with other of the higher arts, came to an end in Florence, and Mantegna and his school had one by one died out, the class of engraver of which I am now speaking first arose. Of that class, Marc Antonio was the acknowledged head. Practising in Rome, his office was not, like that of the modern engraver, to copy the finished picture of the painter; but, on receiving from him a mere sketch or suggestion of the design he contemplated, to carry out that design, and finish and perfect it on his plate. Imagine the effect of such an order upon an engraver of the present day! Of Raphael, say, who was one of the few painters who did not engrave his own works, coming to him with a pen-and-ink sketch of the *Massacre of the Innocents*, some of the figures mere nude studies, and others of them only more or less clothed, with the request that the finished plate, as we now know it, should be completed to satisfaction, and delivered to him within a given time. Yet, as may be seen by a reference to the diagram, Marc Antonio was by no means the only artist of this class capable of such a *tour de force*, Marc da Ravenna, Agostino Veneziano, and others being quite as capable. Here then was an engraver if you please, fit to rank with the painter, and who, though not painter, might yet quite reasonably have aspired to academic distinction, had there been such a thing, and to share with the painter any honours and advantages which the profession of their day had to offer.

There remains to be noticed the engraver of the present day. I have nothing to say to his disparagement. I have had many pleasant relations with him. He has done good work in his time by reproducing for us, albeit in a terribly mechanical fashion, memoranda of great models which would not otherwise have come down to us. He is a Royal Academician, a dignitary of art, of whom—lest I should be accused of making “an attack on the Royal Academy,” which, by-the-by, is the stereotyped phrase for the expression of any difference of opinion which a thinking man may honestly have with that high-handed body—I prefer to maintain an absolute silence. Besides, *de mortuis nil nisi bonum*. A mechanical engraver, greater than he, a better “translator,” and even a better “interpreter,” has arisen, with whom he will find it in vain to compete. The *inertia* of his academic preponderance, hold on to it as he may, will avail him nothing. His great automatic rival, the sun, will outshine him at last; and the plaintive offer of a prize for his recovery—for the restoration of “The Great English School of Line Engraving”—which I gather from the speech of the president at a recent dinner of the Academy, is to be its magniloquent title, will do nothing to revive him. The only fault I have to find with him, therefore, and with the body of which he is a part, is that, being moribund and contributing little or nothing to art, or at best nothing better or so good as we saw on the screen, he should be holding his position to the damage and exclusion of his more original and intelligent rival, and, by means of the opportunities afforded him by the position he holds, be depriving him of his due share of academic representation. His right to this exclusive occupation, and the power of obstruction which it gives him, as well as the right of the Academy to invest him with that power and uphold him in it, I respectfully challenge. Year after year, for now upwards of twenty-five years, original etchings and engravings, many of them destined to live when much of the *ad captandum* and mechanical steel-plate engraving of the day shall have been forgotten, have been sent into the Academy to be, if not turned out again, thrust into corners, and hung without order or distinction among engraved *réchauffés*, and what may not improperly be called the odds and ends of the exhibition. In no single instance, during the whole of that time, has the slightest notice or encouragement been given to any one of them, while in opposition to the best traditions of the Academy, which repudiates the copyist in any other shape, the mechanical engraver, the adapter of other men's work to purely commercial purposes, has been accorded its fullest honours, and even put upon the council, whence, if so minded, he may effectually stamp out the efforts and mar the fortunes of his more legitimate rivals. That the ostracism here complained of has the approval of the more enlightened members of the Academy—some of whom are etchers, and more promising to become so—is not suggested for a moment. Still the fact remains, and it is no explanation of that fact to say—as has been somewhat unhandsomely said—that the complaints justly and necessarily made of it imply an attack on the Royal Academy. Meanwhile, and notwithstanding the discouragement and rebuffs he has met with, it is the humble belief of the writer of this paper that the efforts which he and others have now been making for so many years have been in the true interests of art, the artist, and the public, and he will even add of the Royal Academy itself. Of art, since, if his views were accepted, it would restore to every branch of it that inestimable quality of originality which, as has been shown, is its first principle; of the artist, since it suggests to him a ready and legitimate means of extending his reputation, increasing his income, and insuring for his work a more painter-like representation than it gets at present; and of the

public, by giving them, instead of art furniture, something to hang on their walls capable of exciting their interest, elevating their taste, and speaking to their intelligence. Nor to the Royal Academy itself, as representing the profession of art, is the service rendered by the much-abused amateur less obvious, since, by spreading a love of art, and some understanding of it among classes hitherto unpenetrated by it (as is being done systematically, and at their own expense, by the Burlington Fine Art Club), for instance, he enlarges the painter's market, and becomes the remote, if not the proximate, cause of that increase in his fortunes which is a phenomenon of the age. To deride and discredit him, therefore, is, to say the least of it, an unintelligent mistake. Nor, considering that before the great tempter in the shape of the dealer came to him it was to the amateur, the lover of art for art's sake, that he looked for the sale of his work, is the present attitude of the painter towards him either generous or becoming.

There is yet another thing that members of the Royal Academy, anxious for its honour, should not forget, while considering the question suggested by this paper, and that is that, by persistently refusing, till too late, to recognise the claims of the great school of English water-colour painting, it is indirectly responsible for its decline, directly responsible for the painful fact that such men as David Cox, Peter de Wint, W. Hunt, and Samuel Palmer lived and died outside its walls. It is no excuse for this painful instance of neglect and injustice to say that, the charter of the Royal Academy being founded in oil, no room can be found in it for the painter in water-colour. All that can be said to that is, that it ought not to be founded in oil, but on art; and, again, not on one, but on every form of art which may properly be considered a “fine art.” Suppose, as a *reductio ad absurdum*, it had been founded on water—then the fresco painters would be at the top, and the oil men nowhere. How would they like that? That time would surely seem to have come when, on the simple ground that the material employed in art production has nothing to do with art, the etchers and the water-colour painters now refused representation in the Royal Academy may reasonably demand it; and if by the charter of the Academy as it now stands such reasonable representation cannot be accorded them, then that a charter so little in accord with the intelligence and wants of the age should be altered, and the injurious monopolies which it sanctions and protects done away with. Or, as a *pis aller*, why not, as is actually done in the French Salon, divide the art of engraving into the two classes which I have here suggested for it; that is to say, into *L'eau forte* and *La Gravure*, and give to each a distinct representation? To refuse to do so, as the Academy is doing, is simply to remain behind the age, and to justify to the fullest extent every word here written. The question, however, remains, not what the Royal Academy may or may not choose to accept as forms of art worthy of its encouragement, but which of the two forms of engraved art—that which is original, or that which is not—has most claim—*extra muros academia*—to be considered “fine art.” That question, I venture to think, has been fairly put and fairly answered in the present paper.

ANCIENT GREEK SCULPTURE.

THE third lecture of Professor Mahaffy's course on Greek Art was delivered in Dublin on Saturday. The lecturer began by alluding to the almost uniformly religious character of all the remains of Greek art. Hardly a remnant of ancient art relating to private life was older than what had been found in Pompeii, and which was as much Roman as Greek. The cause of that was obvious. The life of the Greek was an open air life, carried on, not in houses, but in public places, porticoes, temples, and theatres, and the only secular remains were the porticoes, temples, and theatres. The religion of the day transfused the whole of antique life. They remembered what struck St. Paul when he visited Athens—that the whole city was, as he said, given to idolatry. At every turn and corner there were temples and shrines and votive offerings to the gods. These beautiful art works, devoted to a false religion, were hateful to the little ugly man, as he himself told them he was, who hated art as every Semite did. By a strange irony of fate, the religion that Paul preached had preserved for us some of the greatest of those remains. Had not the Parthenon and the temple of Theseus been made Christian churches not a stone of them would now exist. In fact, all the remains had gone but the edifices of religion. He would on that occasion discuss the sculpture of the best Greek periods, and would divide it into that connected with architecture and what he would call free sculpture, or separate statues having no relation to any building. The architectural sculpture had fared best, because it was most out of the range of mischief. They had the pediment of the temple of Ægina, which was preserved in Munich, and a copy of which was in the British Museum. The other day the temple of Olympia was discovered, and they had also the Parthenon, and the temples of Theseus and Erechtheus at Athens, and a temple at Bassæ, in the middle of the Peloponnesus, in which there were very fine sculptures. The dates of these remains were close to each other. It was known that Phidias worked on

the Parthenon, and that the architect Ictinus was employed upon it too, and also built the temple at Bassæ. Nevertheless, there were considerable differences of style between them. There were three parts of the temple in which sculptured ornament was employed—namely, the metopes, which were originally openings to let in light, the friezes which ran like a belt round the top of the main structure, and the triangular gables or pediments. Only in the Parthenon could examples of all the forms employed in these respective places be seen. But recently German investigators had discovered the temple of Olympia and a number of splendid figures. An earthquake had destroyed the temple by throwing the walls outwards in all four directions, so that the figures were flung from a height a considerable distance upon the level soil. And in these figures they had what existed nowhere else in Greek remains—complete noses. In other cases noses had been supplied to defective figures by the artists of the Italian Renaissance period, and these exhibited a considerable want of fineness compared with the Greek noses. Nothing was more offensive in the restored figures met with in the galleries of the Vatican than the fifteenth-century noses on faces that belonged to four centuries before Christ. On account of the triangular shape of the gable the central figures of the groups introduced were colossal in size and erect in posture, while at the angles the figures were lying down. In the temple of Olympia the groups on the western pediment represented the battle between the Lapithæ and the Centaurs, the central figure being one of Apollo. The Greeks did not make external nature the subject of their art at all; they only represented scenes or places by the local deities that belonged to them. He next came to the Parthenon, which was a much superior structure to the Temple of Olympia, being in all respects and details most finished. Only those who had gone minutely through it could form an adequate idea of its extraordinary perfections, and of the frieze of this temple, which was three and a half feet broad, and the relief very shallow. They knew from Xenophon that no procession in which horses were included was thought anything of unless the horses were made to go as much on their hind legs as possible. Some first-rate judges of horses had pronounced the legs of the horses in this frieze too small in proportion to their bodies, and the men mounted on them too big; but it should be remembered that the thing was intended to be seen from a height of thirty-five feet, and that it was necessary to bring out the figures of the men as much as possible. The Temple of Erechtheus, in Athens, was of the Ionic order, and richly ornamented. Its front portico faced the Acropolis and the pediment rested not on pillars, but on four beautiful female figures of Kanephoroi, or maidens who bore on their heads baskets containing the sacred things in processions. Only girls of the highest families were selected for that office, and when they appeared they were very much thought of. Nothing was more remarkable in this portico than the way in which the attitudes of the figures were managed, so as to have them accord with a practice of making the tops of the pillars in such buildings lean slightly inwards. This temple was knocked to pieces by the Turks, who, as well as the Venetians and other barbarians, did a great deal of mischief. The artist who constructed this temple was not known, but he must have belonged to the same period as Phidias, having regard to certain conventionalities in the hair and head-dresses of the figures. In the older works there was a certain archaic treatment of hair which proved their date. Proceeding to free sculpture, Professor Mahaffy said he would show specimens from the three most perfect epochs. These were close together in point of time, but exhibited wide differences in development. Critics had pronounced these sculptures to indicate successively an age of realism, an age of naturalism, and an age of idealism. In the first of these periods the artist copied the model before him with all its faults. Examples were seen in the sculptures belonging to the temple of Ægina; and the same thing was represented in modern times by the practice of the early German and Dutch painters, who reproduced extremely ugly models. The period of naturalism was one of artists who saw that their models of men or beasts had defects and endeavoured to correct them. In the stage of idealism the artist strove to give in marble or bronze not merely beautiful figures, but also the emotions of the human mind. One of the greatest naturalist sculptors was Myron, a contemporary of Phidias. While the latter ornamented temples with great images of gods in ivory or gold, the former wrought in marble or bronze, and endeavoured to attain the highest naturalistic effects. A bronze cow that he made was deemed for ages a wonder on account of its life-like vigour. But he stopped short of idealism. Petronius wrote of him that he had no successor in his skill in representing the *anima* or animal life; and Pliny said that, while he had rare power of representing the body, he could not express the *animus* or soul. A discus-thrower by this sculptor was shown. The attitude had extraordinary vigour, but there was little expression in the face, and the treatment of the hair was conventional. The lecturer next spoke of Praxiteles, who was remarkable for his power of expressing the emotions of the mind, and called attention to the perfections of his statue of *Hermes*. His greatest work was his *Venus of Cnidos*. He introduced many innovations. He first represented Venus undraped—a style which was to be seen in the many Roman copies that

infested the galleries of Italy. A generation later, being the time of Alexander, they had Lycippus, who wrought chiefly in bronze. He made a statue of *Alexander* of that material, and was the friend of the painter Apelles. It used to be thought that the age of sculpture ended with Lycippus, but it was known now that beautiful works of that class were produced centuries later—the group of the *Laocoon*, the *Apollo Belvidere*, and the *Venus of Melos*. Portrait busts of poets, orators, and other distinguished men proved that sculpture did not degenerate for centuries after the time of Phidias; in fact, the art lasted for two centuries after Christ. Busts of *Sophocles*, *Euripides*, *Menander*, and the orator *Lycias* were shown, and also a full-length portrait-statue of the orator *Demosthenes*. They could see how faithfully the poor weak body of the ill-tempered water-drinker was represented, for his appearance was ugly, his legs bad, and he had no biceps. One of the last and most interesting examples shown was that of a design on a tomb in Athens, on which the deceased was represented as taking leave of friends before death. In nothing did the Greeks preserve more exquisitely the measure according to which feeling was to be expressed in permanent art than in those funeral monuments, of which a great many remained, and which used to form regular streets of tombs in the most fashionable suburbs of Athens. In these memorials they sought to make death not disgusting and horrible, and the remembrance of the deceased, if not pleasant, at least beautiful to the survivors.

HYDE PARK CORNER.

THE following suggestion has been furnished to the *Times* by a correspondent:—

The success of the improvements at Hyde Park Corner, from an artistic point of view, is I believe, generally admitted, and I venture to think that the new place may be made one of the finest architectural features in London, and, indeed, noteworthy among the beautiful places of Europe.

In order that this may be effected it is essential that the colossal statue of the Duke of Wellington should be removed. Thoroughly bad as a work of art, it would, when placed upon a pedestal of suitable height, overpower its surroundings and mar any attempt to treat the rest of the place in a worthy manner. It is a disgrace and not an honour to the great man whom it was intended to commemorate, and an eyesore of which London would be well rid.

At the same time it is fitting that in the immediate neighbourhood of Apsley House there should be a lasting and grand effigy of the Duke of Wellington, and that his name should be inseparably associated with the spot. The term "Hyde Park Corner," which is now meaningless, should be abandoned, and the place should be called "Wellington Place." As Parliament Square is the home for the statues of our great statesmen, so Wellington Place should be adorned with the effigies of our illustrious warriors. Equestrian statues of Wellington, who should occupy the centre of the place, of John, Duke of Marlborough, of Edward the Black Prince, and of Henry V., should be erected at the junctions of the roads. The arch when rebuilt should be surmounted by a quadriga as was originally intended by the architect. Suitable lamp-posts decorated with trophies of arms ought to replace the very poor lamp-posts which have, temporarily it may be hoped, been erected.

The triangular space at the top of the place, where the statue now stands, is a suitable site for a fountain of similar shape, with a round basin in its centre. The angles of this and the remaining two triangles would remain for the statues of future conquerors, and these spaces should further be adorned with standard bay trees in tubs.

The effect of such a scheme would be to create an imposing and beautiful architectural place in what is now the very eye of London. Any attempt to treat the opening from a gardener's point of view, with dusty shrubs and parched geraniums, would be a dismal failure. The Place de la Concorde at Paris is a type of such an open space treated in a somewhat similar manner. It may possibly be difficult in these days for Government to do much towards such a metropolitan improvement out of Imperial funds. Private munificence, however, is hampered by no such considerations as those which fetter a Chancellor of the Exchequer, and it is difficult to believe that there are not rich citizens who would take a pride in being connected with such a work as I have sketched.

As for the colossus and its ultimate destination, it must be remembered that an ugly thing is ugly anywhere. Its proper destination is the melting-pot. There are not wanting artists who, out of the same metal, would produce a monument worthy of the great duke and of the nation which he served.

A new Publication, *L'Art Ornamental*, has been issued in Paris by M. Jules Rouam, whose skilful organisation has had much to do with the success of *L'Art* and the *Librairie de l'Art*. The price of the publication is merely nominal, in order to make it available to the humblest class of workmen.

NOTES AND COMMENTS.

THE decision in the House of Lords in the case of *YOUNG & Co. v. The Leamington Corporation*, ought to be enough to convince contractors of the necessity of having contract deeds sealed with the official seal. It has been often said that people in their corporate capacity will approve of acts which they would condemn as individuals, and Leamington may be cited as an example. Messrs. *YOUNG & Co.* saved the Corporation from much inconvenience by undertaking work after the failure of the original contractor, and they have been rewarded in an odd way. Some of the learned lords, in giving judgment, acknowledged that it was one of those cases in which the law was not altogether equitable, but there were others who said that the contractors must be made to understand the law, as if the carrying out of works was penal. Leamington has succeeded, but the inhabitants of that fashionable resort have no reason to be proud of the victory.

THE authorities of Oxford University intend to grant the sum of 1,000*l.* a year for three years towards the works which are required for improving the arterial drainage of the Thames Valley. At present the Drainage Commissioners are, with the Conservators of the Thames, carrying out works which are estimated to cost 34,000*l.* But in addition it was proposed to remove the weirs and lock at Iffley and Medley, to dredge the river between Godston and Stanford, and to form a new cut between the Cherwell and the Thames near Christ Church Meadow. The additional works will cost at least 17,000*l.*, and the Commissioners and Conservators did not feel justified in undertaking them without aid from the University chest. The money has not only been granted, but the University authorities waive all claims for compensation in respect of loss of water power at the Weirs Mill, which may be caused by the new drainage work.

THE Earl of MOUNT-EDGUMBE, well known for his interest in archæology and the preservation of ancient buildings, has undertaken, at his own cost, the restoration of the very interesting early church at Raine. It consists of nave, chancel (with sacristy on the north side), north transept, south aisle, and west tower and spire, and was dedicated to St. GERMAN, October 15, 1259. The additions were made in 1321. To the former period belong the transept and sacristy, with its fireplace and lancet light overlooking the altar. To the latter period belong the tower and spire, north porch, and a window in the north wall of nave. The rest of the structure is chiefly fifteenth century. In the chancel is a cinquefoiled piscina, and between the transept and chancel there is a hagioscope. In the chapel at the end of the aisle is a trefoiled piscina. The carved wagon roof of the aisle will be restored: the other roofs are in a decayed and dangerous state. A few original seats with carved ends remain, and will be preserved, and other ancient features of the church will be reset. The moulded altar-slab of the first church is at present one of the paving-stones of the chancel. The restoration will be of a conservative character, and is in the hands of Messrs. HINE & ODGERS, architects, Plymouth, under whose direction the beacon chapel of St. Michael, in the same parish (and of which a description appeared in *The Architect* some time ago), will be renovated. Tradition says that a heathen temple stood on the site of the parish church, and Dr. BENSON, the late Bishop of Truro, suggested that a curious bowl with lips (preserved in the chalice) was used for sacrificial rites.

THE directors of the Glasgow City and District Railway have been again frustrated in their attempts to construct a railway under houses without paying compensation. Two cases were brought last week before the Court of Session, and it was again affirmed that the ancient principle is still applicable, and that the owner of the surface of a piece of ground has rights to all the strata beneath it. What is of more importance, it was laid down by the Lord President that the rights were stronger when a house stood on the surface. According to his lordship, as long as land is unbuilt upon, "land" is the proper description of the property; but when ground is built upon the *solum* on which the house rests is never described as land. The owner, therefore, becomes the owner of house property instead of landed property; and if he conveys his estate, the manner in which he conveys it is by disposing the house with-

out the slightest reference to the soil on which it stands. There can be no doubt of the application of the general rule that the owner of the surface is owner *ad centrum*; or, in other words, the vertical measurement of his property is indefinite—it has no limit. Therefore it seemed to the Lord President to be abundantly clear that where the property belonging to the owner was a house, the ground on which that house stood was just as much a part of that house as the walls or roof of it, and the ground on which it stood was not a few inches, or a few feet, or a few yards in depth from the surface, but it was the entire underlying strata as far as the imagination could carry one. In this opinion the other judges concurred, and unless there is some new discovery by their lawyer the railway company in Glasgow will have to pay for the site of their line.

THE second annual Building Trades and General Manufacturing Exhibition, held in Bingley Hall, Birmingham, which closed last week, was a great success. During the last two weeks the attendance was very large, and included an unusual number of just the class of people for whom such exhibitions are intended—viz. noblemen, landed gentry, well-known architects, contractors, &c., the amount of business resulting being exceedingly satisfactory to the exhibitors. The public and the local press were unanimous in their praise of the variety and attractive nature of the exhibits and of the general arrangements. The whole of the arrangements were under the sole management of Mr. PHILIP SHRAPNEL, well known as secretary to the building exhibitions at the Agricultural Hall. He must be congratulated upon the satisfactory result of his exertions. We learn that already a considerable amount of space has been taken for a similar exhibition next year.

A FEW weeks back there was a "scene" in the Birkenhead Town Council when the tenders for the new town hall were brought up for consideration. It was alleged that duplicate tenders had been received by the architect, and that was enough to cause some of the members to imagine that there had been collusion. But, as is usual in such cases, there have been no piquant discoveries, and the excitement at the time simply delayed the commencement of the works for so many weeks. The tender of Mr. JAMES LESLIE, amounting to 40,497*l.*, has been at length accepted, and it has been acknowledged that the architect consulted the committee in respect to everything which was done by him.

THE earth which had accumulated about the base of the western façade of Lincoln Cathedral, and was 3 to 4 feet deep, has been removed. The advantage is manifest. Previously the shafts and mouldings and arches sprang at once from the ground, without any apparent structural connection. Now the disclosure of the original Norman plinth, hidden for centuries, gives unity to the whole structure, and adds immensely to its dignity. A plan is under contemplation for continuing the work along the southern flank of the cathedral, now buried many feet by the accumulated soil, and lowering the public road which runs round the sacred building. The scheme has been warmly taken up both in the city and in the county. The Corporation of Lincoln are zealously aiding the Dean and Chapter in carrying out this great and long-needed improvement, and effectual pecuniary help is promised by the leading nobility and gentry of the diocese.

THE Prefect of the Seine lately recommended that private consumers should follow the example of the authorities of Paris, and, relying upon the validity of the late prefectorial decree, whereby the price was reduced from 30 cents to 25 cents per cubic mètre, should decline to pay more than the latter. Many large subscribers have in consequence tendered payment at the lower rate. The company naturally resists this pretension, and maintains that, pending the decision of the Conseil de Prefecture as to the validity of the decree, which is now being attacked by the company, every consumer must pay at the old rate, subject to a liability on the part of the company to refund the amount paid in excess, provided the Prefect is pronounced not to have exceeded his powers, and his decree binding, therefore, from the beginning. The recusants have been summoned in the ordinary way in the civil courts, it being arranged to make the first case that comes on a test one. This cause will be heard next week.

DESIGN FOR COUNTRY MANSION.

THIS design is a production of a large water-colour drawing by Mr. EDWARD A. HEFFER, architect, and gives the south-east aspect of a private mansion of considerable dimensions. The style of architecture is based upon the Elizabethan and what may be termed Anglo-Italian, the coarser features of the former being avoided. The treatment of the roof is somewhat French in character. The walls are proposed to be constructed of deep red bricks, with dressings of white freestone. The detached columns to be grey polished granite. The dimensions of the various apartments have been harmoniously proportioned, the morning-room being 30 feet by 20 feet, drawing-room 50 feet by 25 feet, dining-room 40 feet by 30 feet, and library 40 feet by 25 feet. A lofty picture-gallery in the front forms a conspicuous and original feature of the building. The design includes extensive offices, kitchen-court, conservatory, orangery, fountains, statuary, &c.

TIN FACTORY, READING.

THE illustration which we publish this week represents the recently-erected gateway in Crown Street, Reading, forming one of the entrances to Messrs. HUNTLEY, BOORNE & STEVENS's extensive tin factory. The three large piers are of finely-axed Peterhead granite, and the work above is of red brick. The gates are very massive and richly moulded, and the top panels are filled with wrought-iron scroll work, which has been extremely well executed from the architects' designs by Mr. BARFORD, of Maidenhead. The contractor was Mr. W. H. SIMMONDS, of Reading, and the architects are Messrs. MORRIS & STALLWOOD, of Reading, who are also superintending the erection of an extensive fireproof factory now in progress for the same firm.

MANNAMEAD, HONOR OAK, KENT.

THIS house, now being built for Mr. COURTNEY HALLET, is situated in the Honor Oak Road, and commands an extensive view of the country. The house is built of red bricks up to the first floor, and rough cast on brickwork for the remainder. The roof is covered with Broseley tiles with Kentish hanging-tiles. The contractor is Mr. W. ROBINSON, of Burntwood Lane, Lower Tooting. The contract price is 1,200*l*. The architect is Mr. HERBERT D. APPLETON, A.R.I.B.A.

ST. JOHN'S CHURCH, PLUMSTEAD.

THIS church is now being built in a populous neighbourhood close to the Arsenal at Woolwich, and is one of the ten churches intended to be founded by the Bishop of ROCHESTER's Fund. It was necessary to exercise the strictest economy in designing this church; consequently the work is simple but substantial in character, and is faced externally with picked stocks and Douling stone dressings, and internally with red bricks relieved with bands of bricks from Luton. The church is capable of seating 600 persons, and the contract for the work has been taken by Mr. WALKER, builder, of Limehouse, for 3,596*l*., and about 300*l*. more will be required for pulpit, font, &c., to complete. The foundation-stone was laid by Mr. S. CAWSTON on March 17 last, and the architect is Mr. CHARLES H. COOKE, F.S.A., of Burlington Chambers, 180 New Bond Street, W.

TOMB OF SIR JOHN NEWTON.

RICHARD NEWTON, the original name of whose family was CRADOC, is stated to have been the first to assume the name of NEWTON. His father was JOHN CRADOC, and his mother MARGARET MOYTHE, or, according to another pedigree, CHRISTIANA LEY. He was summoned, by the name of NEWTON, to take the degree of Serjeant-at-Law, 3rd HENRY VI., 1424. In 1426 he acted as a Justice Errant, in Pembroke-shire; on October 5, 1429, he was appointed King's Serjeant; in 1430 he was chosen Recorder of Bristol; on November 8, 1438, was appointed Judge of Common Pleas; and on October 14, 1439, he was raised to the Chief-Justiceship, and presided for nearly nine years. His death occurred between November 1448—when a fine was acknowledged before him—and June 16, 1449, the date of his successor's appointment. He was buried in the Wyke Chapel, in Yatton Church, Somerset. His monument, in alabaster, is rich and finely carved, and was once coloured in red and gold, of which

plentiful traces remain. He is attired in his official robes, a coif, a girdle round his neck, a purse at his right side, and a collar of S.S. round his neck. His hands, on which he wears massive rings, are raised together in an attitude of prayer. His head rests on a garb, or wheat-sheaf, which was his crest, and at his feet are two dogs. By his side is his wife, attired in a close surcoat and a mantle, a head-dress somewhat resembling that of the women of Normandy, and wearing a solid necklace and heavy chain of gold. One account gives him two wives—first, EMMA, daughter of THOMAS PERKOT, of Hurleston; second, EMMOTA, daughter of JOHN HARVEY, of London. Perhaps the latter is the more correct. The HARVEY arms are billets and lion rampant, one of the quarterings on the NEWTON coat. There is no inquest post-mortem on the death of the Judge, but there is one on the death of EMMOTA NEWTON, widow, 16th EDWARD IV. She died 1475, holding manors in and about Yatton. Their son and heir was Sir JOHN NEWTON, of Wyke, or Court de Wick, Yatton, who married ISABEL DE CHEDDAR. She is elsewhere described as daughter and co-heiress of THOMAS TALBOT, Viscount LISLE, by ELIZABETH, daughter of Sir RICHARD CHEDDAR. In St. John's Chapel, Yatton Church, is an altar tomb, near that of Sir RICHARD NEWTON, presumed to represent his son, Sir JOHN NEWTON, and his lady. Her head-dress so closely coincides with that of the Judge's wife, that we may well attribute all the effigies to nearly the same period, if not the same sculptor. Sir JOHN and his wife are both of juvenile aspect. Perhaps the effigies were made by his own order, during his lifetime, and not long after his father's death. Sir JOHN NEWTON is in plate armour, with a large collar of S.S., his hands raised in prayer, with a garb for his crest, and his feet on a lion. Sir JOHN NEWTON died 1487. At the back of the tomb there is a fine carving of the Annunciation.

THE ARCHITECTURAL ASSOCIATION.

THE last ordinary meeting of the session was held on Friday evening, the 1st inst., Mr. E. G. Hayes, president, in the chair. A vote of thanks was passed to Mr. Cuthbert for his kindness in allowing the members to visit the Royal Courts of Justice Chambers.

The Travelling Studentship.

Mr. W. R. ATKIN BERRY, hon. secretary, read the report of the judges, Messrs. R. Phené Spiers, Aston Webb, and R. C. Page, for the award of the Travelling Studentship. The report stated that five sets of drawings had been submitted, the whole of the work being highly satisfactory, while the care and skill displayed by the competitors amply testified to the value of the studentship. The judges had no hesitation in saying that any one set of the five was worthy of the prize, so that the selection was not an easy task; they were, however, unanimously of opinion that the studentship should be awarded to Mr. J. Gibbon Sankey; second prize of 5*l*. 5*s*. to Mr. G. G. Wallace; and honourable mention to Mr. G. G. Woodward.

The PRESIDENT said that the other gentlemen who had competed, though unsuccessful, must certainly receive great consolation from the report which had just been read.

The Annual Excursion.

It was then announced that the fourteenth annual excursion would take place from August 13 to 18 to South Somersetshire, with Yeovil as headquarters; and, as only a limited number of members—about thirty or forty—could go, early application should be made to Mr. Pink, who was acting as secretary to the Excursion Committee.

The annual dinner will take place on Friday, June 22, at the Holborn Restaurant.

Mr. H. D. APPLETON then read a paper on

Rural Sanitary Authorities and their By-laws.

The board of guardians, who are appointed to act as the rural sanitary authority for the parishes contained in their union, are empowered by the Public Health Act of 1875, section 157, to make by-laws relating to new streets and buildings.

(a) With respect to the level, width, and construction of new streets.

(b) With respect to the structure of walls, foundations, roofs, and chimneys of new buildings, for securing stability and the prevention of fires, and for purposes of health.

(c) With respect to the sufficiency of the space about buildings to secure a free circulation of air, and with respect to the ventilation of buildings.

(d) With respect to the drainage of buildings, to water-closets, earth-closets, privies, ashpits, and cesspools in connection with buildings, and to the closing of buildings, or parts of buildings,

unfit for human habitation, and to prohibition of their use for such habitation.

(e) As to the giving of notices as to the deposit of plans and sections by persons intending to lay out streets or to construct buildings, as to the inspection by the sanitary authority, and as to the power of such authority to remove, alter, or pull down any work begun or done in contravention of such by-laws. In order to assist the sanitary authorities in framing these regulations, the Local Government Board drew up a series of regulations, which are known as the Model By-laws—not, I take it, on account of their absolute perfection, or that their authors thought them impossible of improvement, but they were intended as a building code, from which certain sections could be taken and adopted to suit the requirements of particular localities.

In a circular letter addressed to sanitary authorities by the Local Government Board, dated July 25, 1877, which was sent, with a copy of the Model By-laws, several interesting explanations were given as follows:—

It will be seen that the model series contain no by-laws specifying provisions for the sewerage of new streets, and the reason for this is that the conditions which such by-laws must satisfy, are to so great an extent dependent upon the varying circumstances of different localities. The Board do not anticipate that inconvenience will result from the absence of satisfactory by-laws with respect to sewerage, for it may be doubted whether any powers which, under such by-laws, may be lawfully assumed by sanitary authorities will, as regards extent and efficacy, compare with powers which they derive from the express provisions of the Public Health Act.

Frequent applications have been made to the Board for confirmation of a by-law prescribing a minimum height for habitable rooms, and it has been sought to justify such a provision as being a by-law with respect to ventilation, and being authorised by section 157 (3) of the Public Health Act, 1875. The form of by-law generally proposed has been regarded as open to objection upon several grounds, and the important question as to whether the requirement of a minimum height for habitable rooms can be enforced by means of a by-law with respect to ventilation under the enactment above mentioned, suggests so many serious considerations that the Board have decided to submit a case for the opinion of the law officers of the Crown upon the numerous points which have been raised in connection with the suggested by-law. The opinion of Sir Henry James and Sir Farrer Herschell, given in the tenth annual report of the Local Government Board, was that an urban sanitary authority has no general power under the 157th section of the Public Health Act, 1875, to make by-laws regulating the height of rooms for the purpose of thereby securing improved ventilation. There may, however, be cases where reasonable regulations made with reference to the mode of ventilation would necessitate the rooms being of a certain height.

Taking the by-laws in the order in which they are given above, I propose to briefly glance at the heads of the various sections, and, as I presume most of the gentlemen present are well acquainted with the by-laws, you will be able to follow me in reference to the interpretation of terms. The definition of party wall as a wall forming part of a building, and being used or constructed to be used in any part of the height or length of such wall for separation of adjoining buildings belonging to different owners, or occupied, or constructed, or adapted to be occupied by different persons, has given rise to several discussions, as probably in its strict application it would require several of the internal walls of a house to be treated as party walls. It would be interesting to know what regulations would govern the alteration of party walls as of course the rules used in the metropolis have no force in sanitary authority districts. The clear definition of a topmost storey makes the thickness of walls greater than under the Metropolitan Act. The list of exempt buildings includes Government buildings. Railway buildings and canal buildings, when built for the purposes of the business of the companies are exempt, but their dwelling-houses are of course subject to the operations of the by-laws. With respect to the construction of new streets, it will be seen that the by-laws do not interfere with the construction of *cul-de-sacs*, but in other respects the regulations are very carefully drawn to prevent the formation of narrow alleys.

The section 53, which requires a sufficiency of space in front of a building of not less than 24 feet, also assists in keeping the villages from becoming overcrowded. With respect to the structure of walls, &c., it is required, under section 9, that all filth shall be removed from foundations; and, under section 10, that the site shall be covered with concrete at least six inches thick. There have been a great many objections raised to this section as unnecessary on some soils, but I think that it is now generally agreed that as all soils are more or less pervious, it is a good section to insist on in all cases. A very useful section has been added to the above, requiring the site of a building which has been previously excavated as a clay pit, or for other materials, to be raised with suitable material to form a stable and healthy substratum.

The regulation with regard to the construction of walls would perhaps be better if the proportion of lime to sand were given for the mortar. Two sections have been added for hollow walls, which require the upper side of all woodwork which may project into the cavity, to be protected with lead or other suitable material; and a

section for half-timber walls, which requires the space between the timber to be filled in with brickwork, and a thickness of at least 4½ inches of brickwork shall be placed at the back of every section of timber. The party walls of half timber houses must be constructed in accordance with the requirements of the by-laws, and project at least one inch in front of any timber framing in any adjoining external wall. I do not recollect ever having seen this carried out in the charming designs that are exhibited at the *conversazione*, and in several other points I have noticed a lofty disregard for building acts and by-laws. As the by-laws are being rapidly adopted all over England—in a short time I have little doubt that they will be almost universal—it would evidently be as well, I think, if the various requirements were borne in mind when the designs are being worked out. I may be met by the objection that there were no restrictions with regard to building in the best periods of architecture, and that they hamper design and limit experiments. It is a great drawback, doubtless, that our canon of taste is a reference to work carried out under such different conditions. The 13th section, requiring walls to be true and plumb, does not, as some have supposed, prevent the construction of projections, it is simply intended to apply to careless workmanship. With regard to section 17, regulating the position of the damp course, viz., 6 inches above the surface of the ground adjoining such wall and beneath the level of the lowest timbers, a proviso has been added requiring the walls of basements to be built hollow, with 2½-inch cavity, and carried up 6 inches above the surface of the ground, and two damp courses, one at the base and one at the top of the hollow wall. In the case of shops, where the floors require to be nearly on a level with the ground, a small dry area 6 inches below the level of the damp course can be formed to meet this section.

Section 18. The height of a storey is measured from the upper surface of the floor of the storey to the upper surface of the floor above; this is a point that is often overlooked, as most people think the height of a storey is the height of the room. It will be seen that a room enclosed with 9 inch walls cannot be 10 feet high; it also affects the construction of the walls, as the set-offs have to be made at the top of the joists, not under the plate, as is usually done.

Sections 19 and 20 regulate the thicknesses of walls, and they all run a little thicker than the Metropolis Building Act, owing to the definition of a topmost storey, and a regulation that a brick wall does not comprise more than two storeys.

Section 22 applies to other building material than brick.

Section 23 regulates openings in external walls in the case of corner shops, without a pin at the angle, the distance of the pins must be within 3 feet of the corner or angle of the street.

Section 24 requires all woodwork to be set in reveals 4½ inches from the face of the wall, except shop-fronts, loophole framing, or, of course, houses built of half timber in accordance with the by-laws.

Section 25 requires parapets to external walls when the walls are within 15 feet. This is sometimes modified by allowing buildings under 30 feet to be exempt from this by-law.

Section 26, requiring parapets to all party-walls, is sometimes modified in the case of small dwelling-houses under 30 feet in height by allowing the party-wall to finish under the tiles or slates of the roof, the tiles or slates being bedded on the wall in mortar or cement, and no lath, timber, or woodwork extending across any part of such wall. This proviso, no doubt, is a source of great comfort to our artistic friends who lament most bitterly when they are obliged to cut up their effective roofs with parapet walls, sometimes intersecting gables in a most interesting manner.

Sections 27 to 34 relate to the construction of walls, parapets, recesses, and bond timber in walls, templates, and bearing of girders.

Section 35 requires the open spaces inside partitions or between the joists to be filled up with brickwork. This is to prevent the rapid spread of fire.

Sections 36 to 51 relate to chimneys. Amongst other regulations they require every copper flue to be 4½ inches thick. This is a deadly blow at one of the favourite pieces of construction of our friend the speculating builder.

Section 52 requires all roofs, &c., to be covered with incombustible materials. This prohibits the use of thatch.

Section 52A provides that all eaves shall have gutters and stack pipes.

The regulations with respect to the sufficiency of the space about buildings to secure a free circulation of air, and with respect to the ventilation of buildings I have already alluded to, the section requiring a space of not less than 24 feet in width throughout the whole line of frontage. This space must never be affected by subsequent alterations; the only buildings allowed are porticoes or fence walls not exceeding 7 feet in height.

Section 54 regulates the space in the rear of the house, which is governed by the height of the building not the number of storeys, and this space must extend laterally throughout the entire width of the building. The minimum distance of 10 feet for this space affects the regulation for the construction of a privy, which, through the section, cannot be more than 6 feet from the house.

Section 55 provides that a sufficient number of windows shall

be made opening on to these air spaces; and section 57 requires all windows to be at least one-tenth of the floor area of the room, and so made that one half may be opened, and such opening must extend in every case to the top of the window.

Section 58 requires an air-shaft of an area of 100 square inches in all rooms without chimneys.

These regulations are well worth the careful consideration of the members of the classes of design, as it is on these points that I have often noticed their designs could not be carried out under the by-law.

Section 59 is as follows: Every person who shall erect a new public building shall cause such building to be provided with adequate means of ventilation. This throws a dreadful responsibility on the sanitary authority. Fancy a body of gentlemen not specially trained being suddenly called on to decide the nice question of what constituted adequate means of ventilation for a public building.

With respect to the drainage of buildings section 60 requires a subsoil drain to be laid in when necessary, such drain to be provided with a properly-ventilated trap before being connected with the soil drain.

Section 61 regulates the level of basements, requiring them to be at a level above the sewer, so as to allow of their being properly drained. This section is rather difficult to carry out when there is no sewer, as it entails the construction of the cesspool at such a depth that it is very expensive and difficult to empty.

Section 62, regulating the construction of drains, is very important, and it may be noticed that the diameter of the soil drain is to be not less than 4 inches, small drains being just now in fashion. The bed of concrete required for the drains is to prevent their sinking when the ground above is rammed in.

The section 63, requiring a trap in the drain within the curtilage of the building and as close to the sewer as possible, has to be slightly modified when the house is built on the edge of the path, as, in order to ventilate the drain on the house side of the trap, the trap must be laid under the path.

Section 64 requires all junctions to be Y junctions.

Section 65 contains an elaborate description of two methods of ventilating the drains, to which some objections have been taken. The difference between the two methods being whether the inlet shaft is placed near the sewer or at the other extremity of the drain. The principle of the section is that all drains must have two untrapped openings at least, one to act as an inlet and the other as an outlet shaft. The outlet shaft is to be not less than 4 inches in diameter, and a continuation of the soil-pipe is allowed. It is very undesirable to allow rain-water pipes to be used as outlet shafts, as the gas is blown under the slates and into the houses.

In section 66, the construction of the soil-pipe is carefully laid down, also waste-pipes and slop-sinks.

Section 67 regulates the position of water-closets. It is required that one of its sides shall be an external wall. This is necessary in order to comply with the following section, which requires all water-closets to have a window opening in an external wall not less than 2 feet by 1 foot, and, in addition, an air brick, to insure movement in the air.

Section 69 regulates the water supply to closets, and the form of the apparatus. Sections 70 to 79 deal with the construction of earth-closets and privies in a most exhaustive way. Sections 80 to 85 deal with the construction of ash-pits. Sections 86 to 89 deal with the construction and position of cesspools. In sanitary authorities' districts these clauses are always very much discussed, as the minimum distance of 50 feet from a dwelling-house or place in which any person may be employed is very often very difficult to get. It is curious that though the section prohibits the construction of a cesspool within 50 feet of a dwelling-house it does not prevent a dwelling-house being built within 50 feet of a cesspool. The construction of water-tight cesspools is insisted on in section 89. In respect to the closing of buildings unfit for habitation, which have been erected after a certain date, section 90 gives the sanitary authority power to close them. With regard to the vexed question of giving notices and depositing plans of proposed new roads and houses, this, I believe, is looked upon by many as a very annoying requirement; at the same time, there are so many points which are regulated by these by-laws, and which, without the plans it would be so difficult to trace, that the trifling expense of providing an extra set of tracings is very little to complain of. The sanitary authority are, by section 158, obliged to signify their approval or otherwise of the intended work within one month after the notice, but they cannot compel the builder to wait until they approve the plans before commencing building, but of course in the event of the building not being in accordance with the requirements of the by-laws they must alter them. In conclusion, gentlemen, while thanking you for the attention with which you have followed this very dull discourse, I would add that all I have endeavoured to do is simply to touch on those points which I thought would be of interest. I have not attempted to make any suggestions as to alterations in these regulations.

The PRESIDENT said that Mr. Appleton's paper, though short, had raised many points for discussion. They all looked on these regulations as an unmitigated nuisance, and did not trouble their heads with them more than they could help; some discussion of

the subject might help them to take a more favourable view of the laws. Some regulations were certainly open to objection; he could never see the object, for instance, of requiring a complete set of designs to be sent in. If an architect were employed, the local authorities might take it for granted that the building would be fairly well arranged and designed. Regulations also varied, he presumed, in different districts, for instance, as to parapets, carrying up of party walls above roofs, &c. Mr. Appleton's remarks probably referred to some one particular district which he had selected to speak of.

Mr. J. A. GOTCH, who proposed a vote of thanks to Mr. Appleton, said he heartily agreed with the President that model by-laws were a nuisance. It would simplify matters if, instead of having an elaborate set of rules, everyone about to build would employ an architect; it would do the profession a vast amount of good, and the country would derive an equal amount of benefit. Rules cut both ways, and while they stopped bad work they also hindered good work, and very much hampered anything like freedom of fancy. He was quite sure the laws, and the putting them in practice, varied in different parts of the country. In some districts the rules were nothing like so strict as shadowed forth by Mr. Appleton; architects were not near so hampered. Where they might be hampered was in connection with the surveyor. Mr. Gotch said he had not thoroughly thought the matter over, but his opinion was that the surveyor should not be a practising architect. He had heard of clients telling architects that they would employ them, but if they gave the work to the surveyor, they knew the plans would be passed by the authorities, and that the plans of the architect would not. Much, however, lay in the sort of person they had to deal with in the surveyor. The surveyor was supposed to see that the plans were properly carried out, and the by-laws adhered to. But if the laws were strictly interpreted, he was sure that they were not properly carried out in many districts. The surveyor was nearly always underpaid for one thing, and for another, it was impossible for any one man to keep his eyes on the building that was going on. Trust to a certain extent must be placed in the builders, and very rotten reeds they were to trust to. A ground plan, section of floors, and a general idea of the drains was all that was given to the authorities; in fact, the very least the surveyor would be content with was all he got. As little as possible should be shown on the plans, far less should any pet schemes be shown to the rival practitioner.

Mr. F. R. FARROW said that having got used to the metropolitan building by-laws, it was a troublesome thing to have to learn a different set of by-laws each time they had any work to do in the country. From this point of view it would be an advantage if there were one universal code of by-laws not only in London, but throughout the country. There would be then no excuse for not being well up in the rules, and as a result building operations would be carried out in proper conformity to the rules. Mr. Appleton had missed, he thought, the great objection they all felt in giving copies of their drawings to the local authorities; it was not so much expense or trouble they objected to, as the furnishing another man with the product of their brains.

Mr. C. H. BRODIE mentioned that he had found a builder constructing a dry-built cesspool in the neighbourhood of London, though it should have been lined with cement. When he asked if the district surveyor had seen it, the builder answered that the surveyor had not, and added that he did not mean him to see it. It was of course a general complaint that district surveyors made use of architects' drawings. It certainly was a hardship that directly the surveyor knew that an architect was to be employed he was down on the architect for a most complete set of plans, whereas it did not matter what sort of plans they were if it was a speculating builder.

Mr. W. H. ATKIN BERRY, hon. secretary, said that Mr. Appleton needed to make no apology for what formed the subject of his paper. They were apt to think these things offensive, and to hold their noses when the word "water-closet" was mentioned. They would have to encounter the matter some time or another, and it was not the time to learn when the work was waiting to be done. Their gratitude would be due to Mr. Appleton if his paper was the means of directing their attention to these practical subjects. The use of cesspools, especially dry-built cesspools, ought, Mr. Berry said, to be made penal; they poisoned the water supply, and it only required time to bring about an outbreak of epidemic in the village. They might urge their clients to use earth-closets. He knew persons looked askance at the idea first of all, or if they tried them, took a prejudice against them. But this was only because they were not attended to. If properly used and properly attended to, the earth-closet, and he spoke from personal experience, was a most useful thing, and far better than cesspools, &c.

After some observations from other gentlemen the vote of thanks was passed unanimously.

Mr. APPLETON, in replying, said that of course these laws might be abused, but the answer to that was not that one should evade the law oneself. The by-laws did not state in so many words that elevations were to be supplied along with plans and sections, but he thought it was implied. His paper was based on the most recent issue of the model by-laws of the Metropolitan Board. All the points he had referred to would be found fully treated of in an

annotated work on the by-laws published by Knight & Co., which contained also numerous diagrams illustrating the subject, drawn by Mr. Roger Field. Mr. Appleton said he agreed with Mr. Gotch that the by-laws acted as a sieve, which sifted but indifferently, letting through a few architects and a great many builders. But then of course it was possible to drive a coach-and-four through any Act of Parliament. The complaint against surveyors acting as architects was perhaps right, but still it was rather a low view to take of the profession generally. Mr. J. D. Mathews had read a paper at the Institute, suggesting that the metropolitan model by-laws should form the basis of a universal code for the country. In the discussion which took place then, and again later after Mr. Boulton's paper, the suggestion was opposed, for the requirements of different localities were so varied that a system of laws drawn up with such minutiae would, it was thought, make the confusion worse confounded. For one thing, the by-laws were an excellent school for builders. There was no saying what horrible things builders were capable of, but by the time they had got their plans passed by the authorities the builders had gone quite through a process of liberal education. Speaking of cesspools, Mr. Appleton said it was not perhaps generally known that it was in the power of the inhabitants of any particular locality to bring considerable power to bear on the authorities to have drainage works carried out. Boards of Guardians, &c., required pressure to be put on them before they would move in these matters. One difficulty with earth closets was that only one-fifth of the slop water was got rid of. Getting rid of this slop water was the great difficulty in low-lying districts. The point about concrete was that the site of the house should be concreted. This was very necessary, however good the nature of the subsoil. Chalk, for instance, absorbed nearly 16 per-cent. of water, which would be drawn off somewhere, and naturally would be drawn up into the building. The question of filling up spaces between partitions had always been a mystery to him, and he had never been able to see the good of it. Water-waste preventers, which had been objected to as not permitting of a sufficient flush of water in certain cases, was hardly a by-law consideration. It was rather a requirement of the water companies. It was better not to have them if one could have a large and independent cistern.

Mr. H. H. STANNUS said that as it was the last meeting of the session, except a certain convivial reunion which would shortly take place, they could not separate that evening without tendering hearty thanks to their worthy president for the admirable way in which he had presided over the Association, and conducted the business of the session. Among the qualifications of a president he should, for one thing, be a person without extreme or pronounced opinions on æsthetic questions, or questions of high art, ever ready to throw a lance at opponents. There were many forms in architecture but only one spirit; so also there were differences of opinion, the absence of which would not be a healthy sign, and it was the duty of the president to prevent these differences of opinion being carried too far or ruffling the feelings of any, to see that everyone was treated with fairness and equality, to preside, in fact, rather than to be great in arms, or art, or song. Testing their president by these canons, they must all agree that he had done them honour, and had held the balance evenly between all. Mr. Stannus then made some observations on the amount of actual work involved in the presidency along with other duties of the office, all which had been ably carried out by the president. He then formally put a vote of thanks to the meeting, and this was carried by acclamation.

The PRESIDENT thanked the members for the cordial expression of their approval, and remarked that Mr. Stannus had spoken of him in a manner quite undeserved. He could not help feeling regret that this was almost his last appearance among them; somehow or other it was the fact that the occupants of the chair on finishing the term of office invariably dropped out of sight. At the last few meetings of the Association—and these were always the least well attended of the session—had been an extremely good attendance, and during the whole of his long experience of the Association he could not recollect a better attendance at a concluding meeting than they had had that night, and this notwithstanding the subject of the lecture, as admitted by Mr. Appleton, was not one of the most interesting that could have been selected.

Votes of thanks were then passed to the other officers, and among them to the hon. secretaries, Mr. Eales and Mr. Berry; hon. librarian, Mr. Pratt, &c.; sympathy being expressed for Mr. Pratt, who had been prevented attending several meetings by a painful illness.

The Election of Officers.

The PRESIDENT announced the result of the elections for the session of 1883-84 as follows:—

President.—Mr. Cole A. Adams.

Vice-Presidents.—Messrs. H. H. Stannus and F. E. Eales.

Committee.—Messrs. F. T. Baggallay, A. J. Gale, T. Garratt, J. A. Gotch, F. Hemings, H. G. Turner, E. B. P'Anson, C. R. Pink, H. W. Pratt, and V. Trubshawe.

Treasurer.—Mr. J. Douglass Mathews.

Assistant Treasurer.—Mr. A. Conder.

Librarian.—Mr. R. L. Cox.

Secretaries.—Messrs. W. H. Atkin Berry and H. D. Appleton.

Solicitor.—Mr. Francis Truefitt.

Assistant Librarians.—Messrs. W. Burrell and J. C. Carter.

Auditors.—Messrs. W. F. Huxley and G. A. Pryce Cuxson.

Registrar.—Mr. Thomas H. Watson.

Collector.—Mr. Alfred Hill.

A vote of thanks was then passed to Messrs. Jones and Whichcord for acting as scrutineers, and the proceedings terminated.

MANCHESTER CATHEDRAL.

ON the 1st inst., there was a sitting of the Manchester Consistory Court, before Mr. Chancellor Christie. Mr. H. C. Burder applied on behalf of the churchwardens of the cathedral and parish church of Manchester for a faculty to remove the north gallery of the cathedral, in accordance with the report of the architect (Mr. Crowther). He referred the court to a resolution passed at a meeting of inhabitant ratepayers on Monday, authorising the churchwardens to apply to the ordinary for a faculty to enable them to take down the north gallery, and to carry into effect the alterations and additions suggested in Mr. Crowther's report. The Chancellor asked whether it was not intended to remove the south gallery also. Mr. Lings (the comptroller) said they proposed to take down the south gallery also, but not at present, and the cost of that work was included in the estimate of the total cost (25,000*l.* or 30,000*l.*). The Chancellor said he received a letter that morning from Mr. Alderman Lamb objecting to the faculty being granted except upon the churchwardens undertaking to rebuild the gallery. Mr. Lamb said there were many occasions when the galleries were filled to overflowing, and he should greatly regret the permanent removal of even one gallery, which would destroy 500 or 600 sittings. Mr. Lings said the actual loss of sittings would not amount to twenty. The Chancellor: In a case of this kind I ought to require the consent of the Bishop to the proposed alterations. Mr. Burder said the Bishop had given his consent in writing. The Chancellor asked whether any steps had been taken with regard to the graves which might be interfered with. Mr. Lings said there were no actual graves in that part of the cathedral, though there were gravestones there, and they would of course be preserved. The Chancellor decreed the citation, making it returnable on June 22, and directing that all persons claiming rights under the faculty granted when the north gallery was originally erected should be duly cited to attend.

NEWCASTLE SOCIETY OF ANTIQUARIES.

AT the last monthly meeting of the Newcastle Society of Antiquaries, on May 31, the Rev. Canon Greenwell in the chair, Mr. Hodges laid upon the table the first part of his "Remnants of old Newcastle-upon-Tyne," containing ten views, and hoped the following parts would find favour with the society. Mr. Septimus Oswald read a paper describing the ruins of the church of the Holy Cross at Wallsend. He stated that the entrance doorway on the south side was undoubtedly original; the style was between the early and late Norman, which prevailed from about 1066 until a change set in towards Early English about 1190. It might safely be inferred that the church was built between the middle and close of the twelfth century, and was contemporary with the Keep at Newcastle. The ruins at present consist of a portion of the south wall, including the entrance doorway, and also the south porch, which was comparatively modern, not tied in with the original wall; the west wall, five or six feet in height, and traces of the foundations. He suggested that leave to excavate the foundations might be got.—On the motion of Mr. Longstaffe, seconded by Mr. Hodges, a vote of thanks was passed to Mr. Oswald for his paper.—Mr. Longstaffe referred to old bridges in the county of Durham, and said the Framwellgate Bridge across the Wear at Durham was a very beautiful elliptical structure, the date of which was fairly well known. The old Framwellgate Bridge was washed away by the great flood in 1400, and the new bridge would be built four or five years after that. At Gateshead there was a very small bridge, almost identical with Framwellgate Bridge; it was called the High Team Bridge, and it was on the road between Gateshead and Ravensworth. The bridge had been widened, the same as the Framwellgate Bridge, at each side; it was a ribbed bridge with a very delicate elliptical arch. He believed the county authorities had come to the conclusion that a new bridge should be erected. There was a natural ravine at Gateshead Park, and he had suggested to the Gateshead authorities that the bridge should be taken down and re-erected across the ravine in the park. The stones could be numbered when taken down, and he thought the cost of the work would be less than 100*l.* He did not know whether the Gateshead authorities would agree to carry out the suggestion. The bridge was built by Bishop Skirlaw, who seemed to have built many bridges. An ordinary observer would not see the antiquity of the bridge, as, owing to being widened at each side, the ribs were not seen.—Mr. Thos. Hodgkin reported that the Black Gate Committee

had drawn up an appeal for funds to meet the cost of restoring the Black Gate, and Mr. John Clayton, Mr. R. Carr-Ellison, Sir W. G. Armstrong, had each promised 50*l.*, and Sir Charles Trevelyan 25*l.* There had been promised 307*l.*, and he thought 400*l.* or 450*l.* might be reckoned upon before appealing to the general public to make up the amount to 800*l.* He explained that one of the terms of the lease of the Black Gate by the Corporation to the society is that at least 1,200*l.* be expended upon it, and that amount is in hand or promised.—The Rev. Dr. Bruce said Mr. B. Hodgkin and Mr. Robert Spence had each promised 50*l.*—It was resolved that the council of the society be authorised to sign the lease, and also that the tender for the work be prepared for signature.—The Rev. Dr. Bruce laid before the society a number of articles, chiefly of the pre-historic period, from Denmark, sent by a gentleman for presentation to the society.—The Chairman said that when the Black Gate was altered and made into a museum, the society should try and get a representative collection of objects of antiquity in the locality. He had certain Roman remains, chiefly altars and sculptured stones, which he would present to the society when the new rooms were finished, and he urged other members to present articles.

TEWKESBURY ABBEY.

THE council of the Society of Antiquaries have adopted the following resolution, in reply to a memorial of the Tewkesbury Abbey Restoration Committee:—The president and council of the Society of Antiquaries of London rejoice to learn that an opportunity, which may not occur again for many years, now presents itself for securing to the abbey church of Tewkesbury the residence known as the "Abbey House," standing in its own grounds on land which embraces the site of the whole of the old monastic buildings, the house itself being a portion of those buildings. This property is about to be sold under the will of the late proprietor, and the council earnestly hope that funds may be forthcoming to purchase at least the portions immediately adjacent to the church, so as to place these valuable architectural and archaeological features of the abbey in a state of security, and remove what has often been felt to be a great ecclesiastical incongruity. The publication by the society, in 1821, of a series of large drawings and plans of Tewkesbury in the *Vetusta Monumenta*, is sufficient indication of the interest which the society has long taken in that venerable building, and which now induces them to make this appeal on behalf of these adjacent remains, which have unhappily been so long alienated from the edifice of which they at one time formed an integral part, and to which they may now be restored.

THE PROTECTION OF ANCIENT BUILDINGS.

THE sixth annual meeting of the Society for the Protection of Ancient Buildings was held on Wednesday in the hall of the Society of Arts, John Street, Adelphi. The chair was taken by Sir John Lubbock, M.P. The report gave a list of about 120 ancient buildings in this country, besides nine abroad, in reference to which the society had taken steps during the past year, either to induce those in charge of them to perform some necessary repairs, or to protest against such falsifications of old work as were often called "restorations." Among the instances treated more at large in the report some stood out very prominently. Such were the continued "restorations" at the Tower of London; that going on in deprivation of the largest parish church in England—St. Nicholas's, Great Yarmouth; at Peterborough Cathedral; at Croydon Palace; at St. George's Chapel, Windsor; and at Hampton Court Palace. In foreign countries a considerable portion of the society's work in the past year had been devoted to the monuments of Arabart, in Egypt, and to various Italian buildings, such as the Monastery of Ara Coeli at Rome, the Mercato Vecchio and the Ponte Vecchio in Florence, with other buildings.

Mr. Vernon Lushington, in moving the adoption of the report, owned that the fruitlessness of their protests in so many instances made it sad reading, but there were some rays of hope. Their movement was telling on cultivated public opinion, though the struggle in which they were engaged was very arduous. The elements were conspiring with the restorers to spoil the noble buildings left us as a national heritage by our fathers. Too often did they find arrayed against them the influence of rank and fashion, of powerful Church rulers, and of men belonging to the architectural profession, and they must always count on the hostility of the commercial and industrial demon. Against these the speaker invoked the help of all persons of true taste, appealing especially to the conservative instincts of the fair sex, who ought to plead with the youthful Primate to make a stand against the ruin of our churches by "restoration."

Lord Houghton, in seconding the motion, remarked on the two things wanted—the prevention of our old buildings from perishing by decay, and their repair without defacement. To solve the problem artistic taste and historical knowledge were alike indispensable. Instances of complete success were rare. He was

reminded by the presence of his noble relative that Crewe Hall was one of them. His lordship further illustrated the subject by what he had lately seen in Egypt and Rome.

The report having been adopted, Sir John Lubbock made some prefatory remarks on the history of his own Act for the Preservation of Ancient Monuments, before calling upon Mr. R. S. Poole to move a resolution in favour of the measure now before the House of Commons for extending its principle so as to embrace monuments of a later date. Mr. Poole then brought forward his resolution, which was passed.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A PAPER was read at last week's meeting of the Edinburgh Association by the president, Mr. MacGibbon, on "Scottish Castles and Houses." He described the styles of domestic architecture which prevailed in France and England up to the seventeenth century, and pointed out that in Scotland there were no Norman castles or domestic buildings, although churches in the Norman style were pretty numerous. The oldest existing Scottish castles were those of the thirteenth century, consisting of a great wall of enceinte, strengthened with towers at intervals, one of which, larger than the others, was called the donjon. Mr. MacGibbon then referred to examples of these at Bothwell, Dirlerton, Yester, Hailes, &c., of which plans, sketches, and photographs were shown. The War of Independence, he stated, produced a great change in Scottish architecture, and, owing to the poverty of the land, large and imposing castles ceased to be built, the nobles contenting themselves with small towers similar to the twelfth-century Norman towers of England. The finest of these keep-towers were stated to be in Lochleven, Alloa, Clackmannan, Preston, and Borthwick. These keeps were often enlarged subsequently, so as to make them into castles surrounding a court-yard, some fine instances brought forward being Craigmillar, Castle Campbell, Crichton, and Kilchurn. About the same period—namely, the beginning of the fifteenth century—some castles were also designed and built on the plan of ranges of buildings surrounding a court-yard. Of these Caerlaverock and Dirlton were rebuilt on the foundations of the old thirteenth-century castles, and Doune seemed to have been an entirely new design. Tantallon was referred to as a fine specimen of this class, and as further interesting from the traces it exhibits of early attempts to construct castles and raise outer earthworks so as to resist artillery. At the close Mr. MacGibbon was thanked for his paper and for the excellent illustrations displayed on the walls.

LANGLEY CASTLE.

THE members of the Archæological and Architectural Association of Durham and Northumberland a few days ago visited Langley Castle and other buildings in its neighbourhood.

The party first visited the old church at Haydon, which stands upon the hillside about half a mile north from the railway station. Mr. C. C. Hodges read an extract relating to Haydon Bridge and the church from Hodgson's "History of Northumberland," and stated that the old chapel at Haydon, dedicated to St. Cuthbert, is a small Early English church of the Norman type, suited for the exposed position it occupies; the architectural details point to the church having been erected about 1190. A Roman altar is used as a font. The church has recently been restored; and the thanks of the society were due, Mr. Hodges said, to the Rev. J. H. Mandell, vicar of Haydon Bridge, for the care he had taken in watching the restoration and preserving the more interesting details.

The Rev. Canon Greenwell, president of the society, said the restoration of the church might be said to have been really carried out after a proper fashion.

At Langley Castle the members were received by Mr. Cadwalader J. Bates, of Heddon Banks, who has recently purchased Langley Castle and land from the Greenwich Hospital Commissioners.

Mr. Bates read a paper giving a history of the Barony and Castle of Langley. He stated that the ancient barony was about thirteen thousand acres in extent; and he traced the various holders of the barony from 1158, when it was held by Adam, the son of Sweyn. The barony passed from the De Tindals by marriage to the De Boltebys of Bolteby, Yorkshire, and then to the De Lucys. Sir Thomas de Lucy, one of the most valiant knights in the reign of Edward III., held the barony at the time of the battle of Neville's Cross. Sir Thomas petitioned the king, denouncing the devastation the Scotch army had committed on his property, and, to prevent a repetition of this rapine, Langley Castle was, in all probability, begun about 1350, with funds drawn from the spoils of France, and augmented by compensation for losses sustained during the Scotch incursion. A few years later the barony and castle came by marriage into the possession of Henry Percy, first Earl of Northumberland, and after Henry Percy had joined in Archbishop Scrope's rebellion, Henry IV. took possession of the

castles belonging to the earl. Assuming that Langley Castle was reduced to its present roofless and floorless state by fire, Mr. Bates thought its destruction might be attributed to Henry IV., as he first advanced into Northumberland in 1405. After tracing the barony down through the Radcliffe family (who obtained it by purchase) into the possession of the Greenwich Hospital Commissioners, Mr. Bates said the castle of Sir Thomas de Lucy, thanks to its destruction by fire some fifty years after its erection, preserves to us a singularly perfect example of a smaller castle of the fourteenth century. Had it continued to be inhabited all sorts of additions would probably have been made to suit the tastes of succeeding generations, at the cost of architectural purity; whereas, with the exception of some rough-and-ready vaulting in the lower stories of some of the towers, there seems to be hardly a stone that did not form part of the original design. Mr. Bates concluded by stating that, under the direction of Mr. Hodgson Fowler, of Durham, the castle will gradually be restored.

The Rev. Canon Greenwell said his own views were very strong against restoration, which, generally speaking, was another word for destruction. He was sure, however, that nothing of the kind was intended at Langley Castle, which Mr. Bates intended to make into a house where he intended to live. It was a difficult thing to turn a building intended for defence into a building for residential purposes; but they all had had sufficient experience of Mr. Fowler's work in several churches which he had restored, to know that he would not destroy anything he could help, and would not put into the castle any work of an ambitious or pretentious character.

On the motion of Canon Greenwell, seconded by Mr. Thos. Hodgkin, a vote of thanks was passed to Mr. Bates for his paper.

A drive of a few miles further west brought the company to Bellingham church, and Mr. C. C. Hodges stated that he believed the church was the only example in Northumberland of an entire church in the Perpendicular style. The church is in a very dilapidated condition, and the Rev. G. Reed, vicar, stated that the work of restoration will soon be commenced, and he showed plans of restoration prepared some years ago by Mr. R. J. Johnson, of Newcastle.

Mr. W. H. D. Longstaffe spoke in strong condemnation of modern restorers getting illegal faculties for the removal of monuments and hatchments in churches; the destruction in connection with restorations in this country in the last few years had been immoral and disgraceful.

Later on in the day the Rev. Canon Greenwell said it was impossible not to regret the plans prepared for the restoration of Bellingham church; they would be destructive in the highest degree. The only thing the building required was to have the roof put into good repair, or perhaps have a new roof.

DIOCESAN SURVEYORS.

THE following letter from the Rev. J. T. Jeffcock, of Wolverhampton, is taken from the *Guardian* :—

The Incorporated Society has done so much good in time past in compelling substantial walls and general good work, and inculcating a certain amount of architectural taste in church building in England, that its claims ought to be freely acknowledged. A little consideration also will show that it is capable of much good in the same direction for the future; if only by being sufficiently supported it can give grants of value enough to make its assistance sought and, consequently, its architectural criticisms respected and attended to. Its committee of architects, to whom building plans are submitted, contains the names of some of the foremost men of the day in their particular lines. Their opinion, therefore, upon the new churches to be built throughout England would have a felt effect upon the national taste, both in town and country. For what is our present danger as regards the future of English church architecture?

The Dilapidations Act, by calling into existence at least 100 diocesan and archidiaconal surveyors, has changed the position of church architecture in England altogether. Forty years ago two courses were open to a clergyman who desired to build a new or restore an old church: he might call in the local man who knew nothing about "Gothic," but was accustomed to dabble in all styles, and would turn out a *bathos* in any for you; or he might get from London the best man and produce a good church, the best at all events that was realisable in those days of advancing architectural science. Now the case is different; the *bathos* architect has given place to the *mediocre*, who knows or can spell out and compose grammatically a normal Gothic design; while the men of architectural *genius* remain as few as they were in the days of Pugin. But whom does the clergyman nowadays usually employ? The local man; in all probability the official surveyor of dilapidations. And who also is the great man with diocesan church building societies? Very often the same man. Now, I do not wish to disparage this class of useful, nay, often meritorious architects, several of whom I have the pleasure of numbering among my acquaintance. But I do contend that church work is drifting more or less into their hands; and that out of the 100 or so

who form their body, not all have a genius for architecture; some rather had better be described as honest "clerks of the works." What shall we see them by-and-by? Our old churches, instead of being as of yore churchwardenised, will be "diocesan surveyorised"—a much more serious affair, as it will not be confined to whitewash and an odd window or two, or a set of galleries, but will transmute the tone of the church from end to end, and be so radical a reform that we shall not recognise the mediæval builder amidst it, while our new churches will lack "go" and *verve*, and fail entirely to raise any feelings such as true art can inspire.

The only hope I see of staving off this misfortune to the art and taste of England lies in plans being submitted before execution to the Incorporated Society's Committee of Architects. What is positively bad they can reject; what is feeble they can criticise; and when the local man, who occasionally is not free from conceit owing to a moneyed, as distinct from an architectural, success, knows that he has to face this ordeal, he will probably avoid some of his worst individualisms and try at least to do his best.

This will only be done so long as the Incorporated Society can give substantial grants. Grants can only be given so long as money flows in. I trust, therefore, that clergy who combine a love of art and architecture (both God-given) with a love of souls, will help on this society as its past work deserves.

P.S.—In mediæval times different localities had their local types and peculiarities in architecture; but what will future art historians say about the local peculiarities which one average local man in average practice has it in his power to inflict on a single county?

FIRES IN THEATRES.

A MEETING to consider the question of the prevention of fires in theatres was held last week in the rooms of the Society of Arts, Adelphi. Sir Wm. Siemens, presided.

The Secretary (Mr. H. T. Wood) read the report of the committee of the Society appointed to consider and inquire into the subject. After alluding to previous inquiries, the report gave various suggestions as to structural arrangements, with special reference to exits; as to the treatment of scenery and accessories in a way to render them less inflammable; as to illuminating appliances, and as to the organisation of fire brigades. The committee expressed their obligations to the Secretary of State for Foreign Affairs, who had been good enough to procure for their use copies of the regulations in force in Belgium, in Berlin, and in Vienna.

Captain Shaen, vice-president of the Fire Brigade Association of the United Kingdom, characterised the annual inspection of theatres caused to be made by the Lord Chamberlain as quite inadequate—indeed, simply farcical. Whether the appliances were in working order or not, the inspector was not in a position to say, and therefore the inspection was of no use whatever. The water-pressure in the Strand was insufficient to reach the roof of five or six of the theatres. He held that the Society of Arts had not solved the question; and he suggested that the firemen at all theatres should be enrolled in one body. There should be an established fire drill at every theatre, and the employes at each theatre should be drilled at uncertain periods. The lights on the stage should be subject to strict regulations. Every seat in a theatre should be licensed, and until that was effected they would not be able to prevent overcrowding. A concentration of authority over all such buildings was required, as well as the enforcement of regulations adapted to each place of public entertainment. No set of rules would comprise every theatre in London; the regulations must be adapted to the particular place.

Mr. Hine suggested that there should be doors on springs along the whole length of the side walls, and on a level with the floors. They had to provide against panic, and with the construction of such doorways the panic would cure itself, for the people would naturally rush to the first doorway, and so would relieve the pressure.

Mr. Cornelius Walford said he had visited nearly every theatre in Europe. The only theatres he had seen which were likely to be safe to the public were those of Russia. At St. Petersburg and, in a certain degree, at Moscow, the theatres were built on large open spaces, and the arrangements were exceedingly roomy. The Russian theatre, in point of fact, very largely resembled the Albert Hall, having an inner and an outer shell. Should a fire occur, the people had only to escape to the space between the inner and outer shells and they were safe. So long as theatres were put in holes and corners, and had innumerable passage-ways, so long would they have extreme peril. It was useless to talk about appliances until something was done structurally in the majority of cases. He saw no solution of the question save the gradual burning down and pulling down of theatres, and their reconstruction in a way which would insure the safety of the public.

Mr. John Hebb said no structural exigencies could compensate for want of presence of mind, and he thought it was to the preservation of presence of mind that they should direct their efforts. It amazed him that the society should take the trouble to draw up a report of such a character, for it was not at all calculated to allay

the fears of an audience. He thought that the society was not doing any good work; on the contrary, it was doing a very mischievous thing in calling attention to defects in theatres which were at present incapable of being remedied. The report did not contain one suggestion which was novel or of a practical character; it consisted merely of platitudes. It was an inconclusive report, and, so far as he could see, would serve no practical purpose. The committee, indeed, purposely evaded all the most important questions on which the public desired to be informed. They either said "that it did not come within their purview," or that "they would keep to one part of the subject." The committee would have to devote themselves very much more seriously to the work, their report would have to be of a more exhaustive character, and the suggestions they made would have to be of a practical nature.

Mr. Dixon-Hartland, M.P., considered that the report did a valuable work in calling attention to the subject. He agreed with Mr. Walford that it was impossible to prevent fires in theatres—the average life of a theatre was under twenty-three years; still it was desirable that the public should know they had the means of escape. Panic was the question to be dealt with, and when the public knew that they had the means of escape panic would be diminished. He moved, "That the present system of official inspection of theatres is unsatisfactory, and does not adequately provide for the protection of the public from the risk of fire."

Mr. Liggins seconded the proposition.

Mr. Herman, of the Princess's Theatre, protested against all managers being subjected to sweeping assertions, and called attention to the fact that every one of the suggestions of the committee had been adopted in the case of the establishment which he represented.

Sir Frederick Abel moved—"That it is important that attention should be given by managers of theatres to the known methods of reducing the inflammability of structural and decorative materials, and that it is desirable that more use should be made of such materials." In reference to the use of silicates or other preparations for the protection of wood and canvas from fire, it would be conveying a wrong impression to say that these materials could be rendered non-inflammable; all that could be done was to retard the progress of the fire. Still, that was a great deal to achieve; and it would inspire the public with additional confidence if they could know that the woodwork, scenery, and accessories were so protected.

On the motion of Lord Alfred Churchill, seconded by Mr. Walford, it was also resolved—"That in all cases where serious loss of property has occurred through fire, provision ought to be made for holding an official inquiry by some competent authority."

A vote of thanks to the chairman brought the meeting to a close.

LEGAL.

House of Lords.—June 4.

HUGHES v. PERCIVAL.—THE HAYMARKET ACCIDENT.

This was an appeal from an order of the Court of Appeal affirming a decision of the Queen's Bench Division, whereby it was ordered that a rule for a new trial obtained by the appellant should be discharged, and that the verdict and judgment entered for the respondent at the trial should stand.

The respondent, the plaintiff below, was the occupier of a dwelling-house, No. 3 Panton Street, Haymarket, and the appellant, the defendant below, was the owner of a piece of land at the corner of Panton Street and the Haymarket, upon which stood two old houses, No. 24 Haymarket and No. 2 Panton Street, which immediately adjoined the plaintiff's house on the west side thereof, and were separated therefrom by a party wall. In 1878 the old houses belonging to the defendant were pulled down, and on the site they had occupied a large new building was erected, which fell down just before it was completed, occasioning some damage to the plaintiff's house. It was in respect of such damage that the present action was brought. In answer to the action the defendant pleaded that he had employed a competent architect and proper builders and contractors to do the necessary work, and that, therefore, he was not responsible for the alleged negligence of the contractors, nor for the unauthorised acts of their servants, which had caused the accident. At the trial the plaintiff relied upon the admission of the defendant that the accident was caused by the act of the contractor's men in improperly cutting into the party wall. The learned judge (Mr. Justice Manisty) ruled that the defence set up, even if proved, would not relieve the defendant from liability, as he was responsible for the act of the contractor's men, even although it was unauthorised by him, and he directed the jury to find a verdict for the plaintiff for an amount of damages to be agreed upon. In December 1881 the Queen's Bench Division affirmed the ruling of the learned judge, and an appeal to the Court of Appeal was dismissed with costs.

The case was argued some time ago before their lordships, when judgment was reserved.

Their lordships (Lord Blackburn, Lord Watson, and Lord Fitzgerald) in giving judgment, affirmed the decision of the Court

below. The defendant had a right to utilise the party wall, for it was his property as well as the plaintiff's; but the law cast upon the defendant when exercising that right a duty towards the plaintiff. That duty did not go as far as to require him absolutely to provide that no damage should come to the plaintiff's wall from the use he made of it, but it did go as far as to require him to see that reasonable skill and care were exercised in those operations which involved a use of the party wall exposing it to risk. Such a duty being cast upon the defendant, he could not get rid of his responsibility by delegating the performance of it to a third person. That was the law clearly laid down in "*Picard v. Smith*," and in "*Angus v. Dalton*." But in all cases there was a duty cast by law on the party who was held liable. The order appealed against must be affirmed and the appeal dismissed with costs.

Judgment affirmed and appeal dismissed with costs.

June 5.

YOUNG AND COMPANY v. THE MAYOR AND CORPORATION OF ROYAL LEAMINGTON SPA.

CONTRACTS WITH CORPORATIONS.

This was an appeal against an order of the Court of Appeal dismissing, with costs, an appeal against the judgment of the Queen's Bench Division in favour of the respondents on a special case.

The Municipal Corporation of the Royal Leamington Spa are, under the 6th Section of the Public Health Act, 1875, acting by their council, the urban authority for the district, consisting of the borough. The respondents, as such urban authority, had made a contract under their seal with one Powis for the execution of works for supplying the district with water; but Powis having failed to complete his contract it was put an end to. The council, in their capacity of urban authority, as far as they could do so by resolutions not under seal, authorised their engineer and surveyor, Mr. Jerram, to enter into a contract for completing the works left not completed by Powis. Mr. Jerram thereupon employed the appellants, Messrs. Young & Co., to complete the works, and also to execute additional works. The appellants, having executed the works, received certificates from Mr. Jerram for the payment of the money due to them under the contract. The corporation paid the appellants for the work they had done in completing the works commenced by Powis, but refused to pay them some 6,000*l.* or 7,000*l.* claimed by them in respect of the additional works, on the technical ground that the employment of the appellants was an employment of them not under the common seal of the corporation, and the special case was stated to raise that point alone. The question for the opinion of the Court was whether the absence of the common seal of the corporation in the employment of the appellants, under the circumstances above stated, was fatal to the appellants' right to recover from the corporation. The Queen's Bench Division answered the question in the affirmative, and gave judgment for the corporation, and their decision was affirmed by the Court of Appeal. The case was argued a short time ago before their lordships by the counsel for the appellants, when their lordships took time to consider whether they should call upon the learned counsel for the respondents to argue in support of the decisions of the Courts below.

Their lordships this morning gave judgment in favour of the corporation, dismissing the appeal, with costs. By the Act of 1875, all contracts above 50*l.* in value with an urban authority must be under the common seal of such urban authority. The case was undoubtedly worked great hardship upon the appellants; but it was for the Legislature to determine whether the benefits derived by enforcing a general rule were or were not too dearly purchased by occasional hardships, and a court of law had only to inquire what the Legislature had thought fit to enact.

Judgment affirmed and appeal dismissed with costs.

SCHOOL BUILDINGS.

Carlisle.—The foundation-stone of a block of new Sunday schools, in West Tower Street, has been laid. The schools will be built of brick with red Newbiggin stone dressings, and walls hollow to insure dryness. The buildings will comprise a large hall—67 feet by 28, and 23 high, with a gallery, and capable of accommodating about 400 persons. There will be a platform at the west end, and round the hall will be built a series of class-rooms, sixteen in all. The infants' class-rooms will be partitioned off from the hall itself. There will be four class-rooms at the back of the platform, and folding screens so arranged that they can be divided into two. A library, lavatories, and other conveniences will also be provided. The style may be described as a domestic type of Gothic. Mr. Geo. Black, Carlisle, is the contractor, Mr. Thomas Allen, clerk of works, and Mr. Geo. Dale Oliver, the architect.

Leeds.—New Wesleyan Sunday schools have been opened. The lecture hall or assembly room is 60 feet by 33 feet, with open

timbered roof rising to a height of 30 feet. It is lighted by a five-light traceried window at the front, and on the sides by three-light windows, with traceried rose window, filled in with stained glass at the back, over the superintendent's desk. On either side are eight class-rooms, with entrances direct from this room, four for boys and four for girls, each of which is communicated with by means of electric bells from the superintendent's desk. Separate entrances are provided for the boys and girls, with inner lobbies, laid with ornamental tiling. There is a side entrance with access to the schoolroom, and also to a ladies' sewing-room, 22 feet by 18 feet. A library behind the lecture-hall and kitchen, with lavatories, &c., on the ground floor, and below are the apparatus-room, room for the storage of tables, forms, &c. The work has been carried out by Messrs. Franks & Evans, contractors, Leeds, from the plans of Mr. G. F. Danby, architect, Leeds.

Peterborough.—New buildings in Crown Street, Peterborough, erected under Deacon's School scheme, have been inaugurated. The architect is Mr. J. R. Naylor, formerly of Peterborough and now of Derby, whose designs were selected in competition out of twelve sets of plans. Messrs. Rands & Son, Wisbech, are the contractors; Mr. Walter Hill acted as clerk of works. The style adopted is plain owing to limited funds, so that the architect has depended for effect chiefly on the use of good materials. The buildings comprise a master's house and school for 100 boys, with the necessary playgrounds and offices. The accommodation in the house includes dining-room, drawing-room, study, kitchen, scullery, larder, lavatory, and seven bedrooms. The study can either be used from the school porch or the master's house. It also admits of perfect supervision of the playground. The school premises are entered by a spacious lobby, with corridor for hats and coats. The large schoolroom is capable of seating 110 boys, and has two class-rooms adjoining, each seated for 40 boys. Messrs. Rands & Son supplied most of the school furniture, and the ordinary desks for the boys were obtained from Messrs. Redmayne & May, Sheffield.

CHURCH BUILDING AND RESTORATION.

Alfreton.—On Sunday a new Roman Catholic chapel, dedicated to St. Mary, was opened for public worship in Park Street, Alfreton. The building, which is capable of holding about 100 persons, has been erected for the district of Alfreton, including Ripley and the villages around. The cost is estimated at 250*l*. The architect is Mr. Hall, of Clay Cross, and the builders Messrs. Roe & Gregory.

Ashwood Bank.—The foundation-stone of a new church, to be erected at Ashwood Bank, has been laid. The building is designed in the Early Decorated style, by Mr. W. J. Hopkins, diocesan architect, and is estimated to cost about 6,000*l*. At present it is only proposed to build the chancel, vestries, base of the tower, and accommodation to seat 200 persons, the cost of which is estimated at about 2,000*l*.

Clopton.—The parish church at Clopton has been reopened after restoration. Among the works carried out the modern chancel has been pulled down and entirely rebuilt on the foundation of that of the middle ages. It is about 8 feet longer than the chancel which it replaces. The old flints have been used, with new Ancaster stone for the freestone work. Mr. Herbert J. Green, of Norwich, is the architect, and Mr. Tooley, of Ipswich, the contractor.

Forest Hill.—Six designs having been submitted in competition for St. John's Presbyterian Church of England, Forest Hill, that by Mr. J. Theodore Parker, F.R.I.B.A., of 8 Furnival's Inn, was selected by the committee, and the work is now being carried out by Messrs. Nall Bros., contractors, of Kentish Town.

GENERAL.

The Marquis of Salisbury has contributed 1,000*l*. to the fund for the restoration of Essendon parish church, Hertfordshire. The Hon. Baron Dimsdale has given 500*l*., and the Rev. F. T. Hetling (rector), 250*l*. The full sum required for the purpose is 4,000*l*.

Mr. R. F. Chisholm, consulting architect to the Madras Government, has obtained the prize of 1,000 rs. offered for a design for a town hall for Madras.

Mr. P. Gordon Smith, architect to the Local Government Board, has been deputed to report upon the construction and arrangement of the Berlin hospitals.

Mr. L. Smellie read a paper on "The Timbers used in Buildings," at the meeting of the Glasgow Architectural Association, which was held on Tuesday.

A Memorial of the late Henry Reber, the composer, has been erected in the cemetery of Père La Chaise. The design for it was presented by M. Jal, architect.

Sir John Coode has prepared a report on the proposed road around the Scarborough Castle Cliff. The cost of the wall and promenade is estimated at 124,689*l*.

Messrs. McKissack & Rowen, of Glasgow, have prepared plans for a new United Presbyterian Church, in Bo'ness, which is to cost over 3,000*l*.

A Brewery is to be erected in Quay Street, Gloucester. The plans have been prepared by Mr. W. Bradford.

Mr. Charles Barry is to report to the Birkenhead Town Council on the designs for the Sessions Courts. The fee to be paid is 100 guineas, and an extra sum of 30 guineas if Mr. Barry visits Birkenhead. Nine sets of designs have been submitted for report.

Messrs. Pemberton & Sons, of Birmingham, are the manufacturers of "Sprague's Automatic Window Fastener," which was described last week.

The Organ at Salisbury Cathedral has been encased at a cost of about 1,000*l*., by Mr. A. Robinson, London, from designs by the late Mr. G. E. Street, R.A.

The Manchester Cathedral Restoration Fund has reached the sum of 20,000*l*.

Mr. E. Melville Richards, late borough surveyor of Leamington, has been unanimously approved of by the General Purposes Committee of the Warwick Town Council for the post of borough surveyor.

Designs of Mr. H. C. Charlewood, of Manchester, have been accepted for the proposed new church of St. Michael, Bamford, near Rochdale.

The Mines Drainage Commissioners, at a monthly meeting held in Wolverhampton on Wednesday, empowered the Triumvirate to proceed at once with works in the deep drainage of the Tipton district, at an aggregate cost of some 25,000*l*.

The Leeds Town Council on Wednesday authorised the acceptance of tenders for joiner's work in the library and office divisions of the new municipal offices, at a cost of 6,100*l*.

The Duke of Westminster has intimated to the Council of the National Smoke Abatement Institution his intention to contribute 500*l*. to the Smoke Abatement Fund opened a few days since.

A Cathedral is to be erected at Albany, in the State of New York. The length will be 250 feet, the width with transepts 120 feet, and the height of west front 100 feet. The cost is estimated at 500,000 dol.

Mr. John Hutchison, R.S.A., has completed a mural monument, to be placed in the new Greyfriars Church, Edinburgh, as a memorial of Dr. W. Robertson, late minister of the parish. The memorial consists of a life-size marble bust set in a niche of Belgian marble.

A Loan Exhibition, representative of art and industry, has this week been opened at Wilton in connection with the Literary Institute. A representation in tapestry of the old abbey at Wilton, descriptive of the visit of Thomas, Cardinal Wolsey, dates back as early as 1527.

The Trustees and Director of the National Gallery are prepared to receive and consider any applications which may be sent to them during the present month from provincial institutions (under municipal or other approved local authority) for the loan of such pictures as are available for that purpose under the terms of the National Gallery (Loan) Act of 1883.

The Somersetshire Archaeological Society's annual meeting will be held at Wiveliscombe, beginning on August 21. After the business meeting of the first day the society will explore the archaeological treasures of Wiveliscombe, and in the afternoon a stroll will be taken by Clayhanger and Huish Champflower. On the second day Castle Rock, Gauden, Lydeard St. Lawrence, Raleigh's Cross on the Brendon Hills, &c., will be visited. The members on Thursday will proceed by train to Dulverton, and drive to Brushford, Starnlee House, Tarr Steps, Barlyrich, Burston, &c. In the evenings reading and discussion of papers will take place.

Several Artistic Books have been destroyed in a fire at Mr. Griggs' photolithographic works in Peckham. The entire edition of a volume by Sir George Birdwood on "the Taj at Agra," which was on the eve of publication by Mr. Quaritch, has been consumed. The book was printed in the same style as Mr. Vincent Robinson's work on "Eastern Carpets," from drawings lent for the purpose by Lord Northbrook. These original drawings, by a native artist, are safe, but the expense of reproducing them is too great to hope for another edition being undertaken to make good the one that has now disappeared. The whole stock of the "Portfolios of Industrial Art" has also perished.

The Plans of Messrs. Bottle & Olley have been accepted in a competition of local architects for new Board-schools, Gorleston, under the Great Yarmouth School Board, for 275 boys, 275 girls, and 250 infants. A caretaker's house has been added to the scheme since the acceptance of the design.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 9, 1883.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance; and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

Address—YOCKNEY & CO., Corsham Down Quarry, Wilts.

BY HER MAJESTY'S ROYAL LETTERS PATENT

ESTABLISHED A.D. 1774.

AUSTIN'S

SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Shades, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (Two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making five qualities; and they strongly recommend that in all cases they should be purchased in preference to the patent lines made from jute, which article has neither the strength nor the durability of flax, consequently cannot give so much satisfaction to the consumer. They also invite the particular attention of the trade to their **IMPERIAL PATENT BLIND LINES**, which are very superior to anything yet offered. They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors, and Wholesale Houses in town or country. N.B.—Please note that all our goods as advertised above are labelled either inside or outside with our Trade Mark—The "A.W.O.B." "A.W.O.B."

UNDER THE PATRONAGE OF H.M. THE QUEEN AND H.R.H. THE PRINCE OF WALES.

LONDON PARQUETRY WORKS,
Founded in 1841 for the exclusive production of HIGH-CLASS PARQUETRY. Orders received through
WRIGHT & MANSFIELD, MORANT & CO.,

Also **ENGINE and STONE-BREAKERS.**—Apply, S. MASON & CO., Machine Works, St. Margaret's, Leicester. Can be had on Hire, with option of purchase.

CHIMNEYPIECES, TILES, STOVES, &c.
Large Selection. Good Designs. Moderate Prices. Architects and Builders invited to send their Clients to inspect.

WILKINS & SONS,
88-92 Pentonville Road, N.

PADDINGTON WORKS—13, 14, & 15 SOUTH WHARF, PADDINGTON, W.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK.
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

ACADEMICAL RECOGNITION FOR MINOR ARTS.

HOSE of our readers who have been led to pass over unread the paper of Mr. SEYMOUR HADEN which we printed last week—the title of which, referring only to “The relative claims of Etching and Engraving to rank as Fine Arts,” may not unlikely have created the impression with many that only etchers and engravers were interested in it—we would strongly

advise to peruse it carefully, as in reality a dissertation on certain first principles of all art, which have seldom been expounded so well, or with such apt illustration. Indeed, looking at the peculiar position which “art,” “the arts,” “*arts et metiers*,” and “arts and manufactures,” just now occupy in English criticism, and (so to speak) in the broad field of English international policy, the discussion thus raised, quite independently of the two rival arts which alone Mr. HADEN desires to consider, deserves to be thoroughly and universally taken up by all who can bring themselves to understand what the actual and vital question is.

This question, in few words, is the difference in essential principle and essential value between the artistic work of the man who is the sole designer or creator of the production as it stands complete, and the artistic work of the man who is no such designer, but the producer in a new form involving special skill. On this ground it is that the author of the paper compares “the practice of the painter-etcher, who is an original artist,” with that of the modern engraver, who is not an original artist,” the conclusion aimed at being that the engraver’s work is a “*metier*,” a “mystery or mastery,” no doubt of great consideration as such, but nothing more; whereas, the etcher’s work is an “art,” and a “fine art,” worthy of official academical recognition, not merely on the same level as the best engraver’s work, but on such a higher level as to disparage the engraver’s work, and even thrust it forth from the exhibition at Burlington House as no true fine art at all.

In order that we may come to a clear understanding of what “art” is, or what is called “fine art,” Mr. HADEN very properly points out to us that we practically must adopt the negative process of disengaging it from the other things commonly called by the same name of “art,” and in almost the same sense, namely, *metier* or mastery, and manufacture or artisanship. Whether after all the ordinary conception of the distinction becomes any more clearly defined may be considered doubtful, but there can be no doubt about this, that the artist who produces, whether by designing only or by designing and executing too, a work of fine art, properly so called, in a field which has a history of its own, can hardly fail to see where his fine art lies, and to see also by contrast where, in certain other and perhaps similar work, the art is not fine art, but a *metier* or even a manufacture.

It seems to us that recent discussions which have taken place about sculpture may supply an illustration of this distinction better than almost anything else. Some one takes plastic clay and therewith models a bust. Some one else in certain cases works over this so as to bestow upon it a peculiar finesse, force, and vitality, “investing it,” as the phrase has been permitted to go, “with artistic merit”—a very awkward phrase, by the way, in view of the question raised by Mr. SEYMOUR HADEN. Then comes some one whose humbler function it is to make a plaster cast from the clay model. Then comes some one else, who places this plaster cast on its back, or otherwise as may be convenient to him, with a block of marble fixed close at hand, and by means of a mechanical contrivance transfers laboriously and quite prosaically to the marble the form of the cast. Lastly there comes some one, perhaps the original modeller, perhaps not, who works on the marble without any machine, and, by touching it up here and there more or less as may be requisite, invests the bust with artistic merit for the second time. Now, amongst all these operators, five in number, who is the “artist”? The first modeller, in those cases in which a second follows him,

may be an artist or not as the reader pleases; for instance, he may be an assistant who will in time be a master, but who now designs the work under a master’s direction and subject to a master’s amendment. The second modeller, if there be a second, is unquestionably an artist. The caster is nobody, and the pointer, although he actually carves the marble, little better; the one is a manufacturer, the other practises a *metier*, a mystery if not a mastery. Then the final work upon the marble is fine art, of course, and if done, as it ought to be done, by the same hand that performed the final work upon the clay, these two operations together constitute the operator the sculptor, especially if he be also, as again he ought to be, the original modeller. But suppose the bust to be in terracotta, the modelling then is the whole performance; and it is to be hoped that anyone professing to be the author of such a work may be taken to have done it all with his own hand. The case is obviously similar in a work in bronze. Suppose again, however, that the bust is to be reproduced on a smaller scale in china-ware. A new modeller now comes in, and Mr. HADEN would contend that he is not doing fine-art work. His *metier* is the copying of the sculpture literally in another form of art—for we presume it cannot but be still called a work of art—and copying it in a particular way which is dictated by the conditions of subsequent manufacture, in fact by the baking. It is needless to observe that this modeller is frequently the same person who “invests with artistic merit” the clay of a sculptor who does not do this for himself as he ought to do; but this is only an example of the way in which “arts” and “*metiers*” must necessarily be allowed to meet on common ground, as indeed “*metiers*” and manufactures must also do.

It is here, however, that Mr. HADEN’S contrast between etching and engraving comes in with peculiar force. The etcher (etching his own composition) is the designer as well; he may have previously prepared for his guidance a drawing on paper, just as a painter will do; but the production of the etched plate is itself the work of fine art, just as the production of a picture is; whereas, as Mr. HADEN clearly demonstrated to his audience by means almost dramatic, the line engraver not only copies the painting before him with the strictest fidelity, in merely another form, but he uses a language of drawing which is so singularly artificial, and indeed conventional, as to be in reality not fine art at all but the *metier* or mystery of an “artist” of inferior degree, if an artist in any sense properly so called.

The application of all this to architecture will be found peculiarly interesting, and is easily followed out.

But the practical outcome of Mr. HADEN’S argument, taken in a broader sense than his, is what seems to us to interest the art world of England chiefly. He calls upon the Royal Academy of Arts, as the great Guild of English Fine Art, to show cause why the engraver, with his *metier*, should be admitted to the guild, and the etcher, with his fine art, excluded. This, in the broader sense we refer to, is to some extent identical with what in this journal we have before now ventured to suggest as a coming condition of things, namely, that the Royal Academy shall recognise, without reservation, the minor arts all round. But it is not that etching alone has to be made academical. It is not even that engraving need be thrust forth. It is that a considerable variety of decorative arts and others of subsidiary motive ought to be distinctly identified on high ground with the interest of England in the arts of design. If “trade” is to be shut out, what is trade but selling, and is not selling the object of the exhibition? Again, if there must be an element of exclusiveness for the sake of painting and sculpture, how comes it that architecture is admitted to such company? We grant the fact that architecture is so admitted with manifest reluctance, and none the less contemplated with a manifest want of both interest and intelligence; but this only enhances the necessity for an understanding of some sort, if it can possibly be had.

The simplest explanation seems to lie in the circumstance that the Royal Academy was founded upon the model of the Renaissance academies of Italy. The “sacred circle of the arts,” as used to be said, consisted then of the three great academical arts of the Renaissance, and no more, namely, painting, sculpture, and architecture; the three arts which in the sixteenth century were supposed to be so united in motive and essence, as derived from the antique, that a complete artist was competent to take all three in hand equally well. At the time when the Royal Academy was thus instituted, the

antique being believed to reign by divine right, no inquiry into first principles could so far be allowed. But surely at this time of day we may be said to have changed all that.

Another question, however, is to be asked. Is it really of much account nowadays whether a rising and popular art is recognised by the Academy or not? Mr. HADEN acknowledges that water-colour painting, snubbed by the Academy, has done very well nevertheless, and is likely to do very much better. We wish we could say, on the other hand, that architecture, with the fullest Academy recognition from the first, has done half as well. Perhaps etching might find room elsewhere to more advantage than in the Academy. Perhaps the time is not far off when "the minor arts" at large will be the subject of a popular exhibition without troubling the Academy; we shall see. Our supreme satisfaction after all is to think that all arts, all *metiers*, and all manufactures, which have for their object the advancement of imaginative grace in England, are steadily progressing day by day, whether with academical recognition or without it, in that intellectual public esteem which is far better.

"THE TALE OF TROY."

DRAMATIC performances on the amateur stage do not often claim permanent chronicle, but exception must be made in case of the representations, the fourth of which was last week given at Cromwell House, in aid of the building fund of the King's College Lectures to Ladies. Professor WARR cast into dramatic form selections from the "Iliad" and the "Odyssey" of HOMER, the first embodying the parting of HECTOR and ANDROMACHE, and the presence of HELEN on the battlements of Troy town, PRIAM in the tent of ACHILLES, and the mourning for HECTOR at the Scaean gate. The scenes from the "Odyssey" included ULYSSES in the palace of CIRCE; ULYSSES and CALYPSO in the Isle of Ogygia; the return of ULYSSES to his hearth; the Retribution, or discomfiture of the suitors; and the reconciliation of PENELOPE and ULYSSES under the benediction of PALLAS appeased. Performances were given in Greek and in English alternately, and certain songs and choruses adapted by Professor WARR, partly from HOMER, partly from the Anthology and from THEOCRITUS, were set to appropriate music, of simple and melodious but in no way archaic measure, by Messrs. OTTO GOLDSCHMIDT, MALCOLM LAWSON, WALTER PARRATT, and Dr. MONK. A worshipful company of artists and scholars gave their help to produce a thoroughly artistic result, namely, Sir F. LEIGHTON, P.R.A., Mr. POYNTER, R.A., Mr. G. F. WATTS, R.A., Mr. GEO. SIMONDS (the sculptor of *Perseus*), Professor NEWTON, and Mr. DELAMOTTE, who designed the scenes, grouping, costumes, and tableaux. The scenery was painted by Mr. O'CONNOR. The frontispiece or opening tableau to "The Tale of Troy," designed by Sir F. LEIGHTON, showed APHRODITE lifting the veil from HELEN, who reclined in a half upright posture on a couch, with head bent forward on pendent hand, after the fashion of certain well-known figures on Greek vases; at her side the graceful PEITHO whispered persuasion, while PARIS, conducted by EROS, gazed at "the wonder of the world." The intention in this tableau seemed to be as far as possible to follow the kind of arrangement by distinct groups which we find in Greek art, preserving marked lines, and keeping the figures as much as possible on one plane. The colour also was bright and simple, but not very satisfactory. Among the scenes which followed perhaps the mourning for HECTOR on the battlements of Troy before the Scaean Gate gave most scope for artistic effect, some situations being singularly striking; as, for instance, when ANDROMACHE flings herself on the body of HECTOR, while the wailing women stand around, and HELEN robed in long white tunic and peplum stands watching against the wall. Throughout the whole of "The Tale of Troy" the scenes arranged by Professor NEWTON and Mr. POYNTER preserved a certain breadth and dignity and careful grace of line. In the tableaux and scenes from the "Odyssey" the treatment was richer, fuller, more picturesque, more reminiscent of the classical pictures of PRELLER at Weimar; more of a revival of Greek life and less of an imitation of Greek art. The architectural backgrounds devised by Mr. POYNTER gave fine setting to two tableaux of ULYSSES in the Palace of CIRCE, in which the grouping of the splendidly-attired goddess and her nymphs was beyond praise for pictorial effect. Again,

ULYSSES in the palace of ALCINOUS gave a succession of charming situations: four maidens of NAUSICAA playing at ball in the foreground, while others grouped about the princess behind; ULYSSES received by ALCINOUS and ARETE, with NAUSICAA beside them and the maidens looking on in graceful attitudes, succeeded by the leave-taking of ULYSSES. For picturesque combination, perhaps, the scenes at the Hearth of ULYSSES were the strongest: girls in creamy-white vesture fingering their distaffs formed lovely groups, balanced by the figure of the melancholy PENELOPE, robed in a pale red tunic and darker peplum drawn hoodwise over the head, seated on a couch, with EURYCLEA, in soft grey raiment, beside her; subsequently the figures of EUMÆUS, in his garment of skins, and ULYSSES, in brown short tunic and hood, added contrast and weight to the gracious beauty of the women. The tableau which followed, from the design of Mr. POYNTER, was the boldest in conception, as on the whole it was the most impressive, of the entire series: this figured the retribution of ULYSSES. On high stood the form of the angry PALLAS, shining in white robes, helmet, and armour, erect and magnificently immobile; to the left, ULYSSES, with raised arm bending the famous bow; behind him, TELEMACHUS; on the right, at the corner of the composition, one of the suitors, fleeing with head turned back over his shoulders. The unity of this design, with its strongly felt dramatic purpose, was finely carried out by the actors, and was singularly complete.

The final scene represented the reconciliation of PENELOPE and ULYSSES beneath the presence of the same vision of PALLAS-ATHENE, now benignly regardant, with hand stretched forth in benediction.

The auditorium was crowded at every performance, and warm praise for the completeness and beauty of the Classic revival came from students of HOMER, from the Premier downwards. It seems a good sign of the times that nine ladies capable of undertaking intelligently the speaking parts in the Greek version were to be found; and, on the decorative side, that the performances were furnished with a sufficient staff of fair Greek women without calling in the assistance of a single "professional beauty." The men's parts were not so satisfactorily filled, favourable exceptions to this being the ACHILLES of Mr. G. P. C. LAWRENCE, who was the CASSANDRA in the "Agamemnon" revival of the Oxford graduates, and the PRIAM of Mr. S. BRANDRAM, whose elocutionary power and easy presence stood him in good stead.

WORKS OF THE STUDENTS OF THE SPANISH ACADEMY IN ROME.

[FROM A CORRESPONDENT.]

POSSIBLY stimulated by the example of their French neighbours, the Spaniards have recently established an academy for their art students in Rome. It was opened in the beginning of the year 1881, and was inaugurated by an exhibition of students' works, not repeated until the present year. They may be congratulated on the delightful situation of their institution. It is nearly opposite to the Villa Medici, on a corresponding rise on the other side of the city. It adjoins the church of S. Pietro in Montorio, and is, indeed, partly formed of the convent formerly belonging to that church. It is entered from the lovely plateau in front of the church, so much frequented by visitors to Rome for the noble view of the city and surrounding country which it commands. Passing through a doorway, one enters a court, in which is the celebrated little round temple constructed by BRAMANTE at the expense of FERDINAND of Spain, to commemorate the site of St. PETER's supposed martyrdom. This elegant structure is surrounded with Doric columns, in grey granite, containing a small chapel with a statue of *St. Peter*. From this court the quarters of the Spanish students are reached, which are commodious and delightful.

Of the works here exhibited, though many of them are very creditable, one cannot speak with unlimited praise. There is, throughout, a straining after largeness of manner and manual dexterity which is not always supported on the necessary foundations of preliminary study, knowledge, and care. The treatment is often slight, superficial, even slovenly, which are fatal defects in the training of art students. The only bases upon which a large and broad art can be constructed are a

very earnest and thorough study of fitness and harmony of colour, and complete command of the black-and-white, or light-and-shade portion of the picture, and a regard to perfect justness of tone; the latter quality being the crowning distinction of every noble school and of every great or important work of art. They do not combine the subtler harmonies and relationships of tone, colour, and light, and shade, with the practice of the most worthy examples. They should go back before they can go forward; learn to walk before they can run. There is no royal road to the high results of art. Each step must be made firm and secure from the beginning. Dash, without purpose or knowledge, avails little. Only by thoughtful and patient industry can eminence be reached.

Turning to the consideration of the special works here exhibited we are met by the life-size figures of two gladiators washing themselves after their combat in the arena, by M. CARBONERO. It is vigorous and strong, though with some defects of drawing. The helmet, laid aside with its wreath of laurels, is well and substantially painted. The smaller picture by the same painter, *The Conversion of the Duke of Gandie before the Body of the Empress Isabelle, Wife of Charles V.*, is little more than a rubbing in, merely suggestive of a picture. H. ESTEVAN has a deserted garden-tank with some broken sculptures, cold and meagre in colour and dry in manner, but with a certain open-air effect. The same painter also gives us two charcoal landscape studies not specially remarkable. By M. RAMIREZ we have *Alms given for the Interment of the Grand Conestable, D. Alvaro de Luna, Favourite of John II., King of Castile, Decapitated by Order of that Monarch.* Three monks are sitting by the bier of the defunct, a candle on a large candelabra burning beside it. His head is suspended on a hook fixed to a pole near. A well-dressed youth is putting alms in a copper trencher placed at the foot of the bier, some compassionate women standing by. In the distance are the castellated towers of the town rising against a gray and clouded sky. In spite of the importance evidently claimed for this picture it fails to impress one with the reality of the circumstance. It is wanting in dramatic force and energy; it is mechanical and academic, although it assumes a painterly treatment. But even here it fails, in the want of a certain harmony and just judgment of the effects of colour. It is, however, in many respects a creditable work. More true in tone and harmonious in colour is *The Last Writing of Cervantes*, by E. OLIVA. CERVANTES, seated, is dedicating one of his books to the Count de LEMOS. An ecclesiastic is holding the book in which CERVANTES writes, others being in attendance. It is, nevertheless, somewhat deficient in spirit and brilliance. T. A. TEJEDOR shows a study of the seated figure of a girl, which is thin and slovenly in treatment, wanting altogether in study and grasp. A. M. DEGRAIN exhibits *An Episode in an Inundation*. A man, a woman, and a child are upon the roof of a house, up to which the waters of a swollen stream have risen, at some distance from which the arms of a sinking mother are raised above the water bearing her child. A Newfoundland dog on the roof of the house is about to dash in to the rescue. The figure of the man is rendered with spirit, but many parts of the picture are weak and reveal deficiency of study.

The examples of sculpture are poor and few. *The Triumph of David*, a relief in plaster by A. MOLTO, is dull and mechanical. *The Model for a Statue of Velasquez for a Monument in Madrid* is more spirited and is suitable for its purpose; it is to be presumed to be worked in bronze.

To this exhibition of students' works has been appended that of the works of the Spanish painters in Rome about to be sent to the forthcoming exhibition of Munich, a short notice of which may not be superfluous.

A large picture, entitled *The Madman's Prayer*, by A. PEREZ, represents the interior of a chapel in a lunatic asylum occupied by a number of male patients clothed in blue blouses. One of them, who is prostrated before a railed screen in front of the altar, writes on the floor with a piece of charcoal, whilst another reads what he has written smiling. Others, seated upon benches, and watched over by an attendant with a stick, exhibit various signs of their demented condition. A draped coffin with candles burning around it occupies the foreground. It is coarsely and realistically painted, lacking any touch of tenderness or sympathy which might redeem it from its harsh attempt after mere sensationalism. Indeed it is deplorable that horror for horror's sake so often forms the main ground of appeal by works of this school. F. PREDILLA has two very

fine studies of heads in water-colour, one of which was reproduced in a large picture which the painter completed a few years ago. F. VILLEGOS has a clever crisp study of two costume figures in water-colour. R. TUSQUETS exhibits a street scene under a strong sunlight, effective, but somewhat forced. V. POVEDA shows a highly-finished picture of two citizens preparing to fence in a court. It is characteristically Spanish in manner, of the FORTUNY and modern RIBERA school. A. TABRÉS gives two oriental street musicians in water-colour, which is clever in textures and crisp in treatment. *A Dead Arab*, by S. S. BARBUDO, is represented stretched upon a carpet, a richly-dressed female watching beside him. It is slightly painted, but clever. One, however, misses in it every trace of human emotion. The same painter shows an effective study of tree-boles in sunshine against a clear, blue sky. A small landscape by J. URÍA is a cleverly-touched palette-knife study, which certainly owes something to chance as well as skill. The last room is occupied by a series of allegorical pictures for the decoration of the staircase of a palace in Madrid, by R. DE VILLODAS. They are painted on an imitation mosaic ground. They represent *Europe and America Crowning the Bust of Columbus, Industry, Mars, Mercury, and Religion*, all with adjuncts and accessories of modern times.

THE HYGIENIC EXHIBITION.—II.

AMONG the filters, manufactured by the Silicated Carbon Filter Company, Church Road, Battersea, shown at the Hygienic Exhibition, Knightsbridge, the Registered Sanitary Ascension Filter only requires to be known to find favour with the public. It is rare enough to be quite exceptional to find a town where the water would not be the better for filtration. However pure the water supply may be, it needs purification after it has run the gauntlet of mains and cisterns; and for one house which possesses a filter ninety-nine others would employ them if, when once purchased, they would do the work required of them for an indefinite time. But, like clocks and watches, they require cleaning, and there is either a difficulty in sending to the maker or it involves more trouble than the greater number of people care to take. Many persons for this reason do not become buyers in the first instance, or if they do, put them permanently aside after a time, and in both cases unfiltered water is used, not that it is preferred by them, but as the less of two troubles. The Registered Sanitary Ascension Filter will meet this difficulty, as the user can by a simple operation take it to pieces and refit it. Besides domestic filters of various kinds to suit any taste or requirement are filters for main supply, constant supply, table and pocket filters, and ship's tank filters. This latter, the Silicated Carbon Tank Filter, is made on such a principle that it will stand the rough usage of a voyage, go through a campaign, &c., is easily cleansed, and, acting as a refrigerator, will keep the water cool in the tropics. Testimony of medical and scientific authorities is not lacking as to the merits of the silicated carbon filters.

Last week Mr. ERNEST HART addressed the visitors to the exhibition on the subject of "Smokeless Fires and Economical Fuel," and in the course of his lecture spoke highly of Messrs. BREYON & COX's (late J. C. STARK & Co., Torquay) gas stove for heating and ventilation, and the "Save All" gas cooking-stove. Both of these stoves were awarded a first prize silver medal at the Smoke Abatement Exhibition. The heating and ventilating stoves are described as being designed with a view to act as a preventive of draughts, and, in addition to warming an apartment effectually, to keep it pure, however crowded. All the heat is imprisoned in the body of the stove, through which tubes run from bottom to top, drawing fresh air, brought by a large tube, direct from out-of-doors, or from some pure source, and discharging it into the room at any temperature desired, up to 300 degrees. Being lighter than the colder air of the room, it at once rises to the ceiling, gradually pressing down and driving out at chimney, windows, and doors the air that has been breathed or otherwise vitiated. Any admixture of the products of combustion with the air so brought in is, from the construction of the stove, impossible. There is an arrangement for carrying off such products; but whether or not this is done, perfect freedom from smell is guaranteed. It is calculated to discharge into an apartment 4,000 cubic feet per hour, at a temperature of 200 degrees Fahrenheit, a result produced by two simple "fish-tail" or "union" burners. The larger the size of the stove the more powerful it is propor-

tionately. The amount of gas consumed is less than in other gas stoves, and a greater effect is produced. It is ornamental in appearance, and is encased in Doulton ware. Similarly for cooking purposes, owing to economy of "fuel" and absence of gas fumes, &c., the "Save All" will prove a desirable acquisition.

A health exhibition is not the place for pigments to put in an appearance, and the presence of the Albissima Paint Company, Lime Street, E.C., at the present exhibition is an exception that aptly proves the rule. The non-poisonous composition of the Albissima paints, of course, is not the sole merit of the Albissima paints, because the tests made as to the covering properties of equal weights of white lead and Albissima have resulted largely in favour of the latter. Paints of assorted colours are kept ready mixed for use, while other tints or shades, as desired, will be made according to order. A monumental erection served to show that the paints were, moreover, applicable for the execution of delicate decorative work.

The evils resulting from the use of poisonous compounds in the pigments or fabrics designed for decorative purposes has given a great impulse to the manufacture of non-poisonous decorations. Messrs. WM. WOOLLAMS & Co., High Street, Manchester Square, whose wall papers for mural decoration and distemper colours attracted attention at this exhibition, deserve credit for the production of materials of much artistic merit, which are free from arsenic. The papers and colours, in fact, were submitted to analysis at the beginning of the exhibition. The wall and ceiling papers comprised patent embossed flocks and raised flocks in various colours, and varnished without painting over, raised flocks for painting over, &c., dado decorations, and the like. From a sanitary point of view it is needless to recommend them, and no one will take exception to them on the score of artistic merit.

The Japanese embossed leather papers of Messrs. C. HINDLEY & SONS, Oxford Street, W., have evidently found favour, and have before this been highly spoken of in these columns. Messrs. HINDLEY fitted up a section of an apartment, and showed what pleasing results can be effected by a modest outlay on inexpensive materials. Therein were to be seen the Japanese and other wall papers—non-arsenical; artistically-designed furniture, old-fashioned chintzes in fast colours and of original design, Crête and Madras muslins, and among other inexpensive decorations, wood mantelpieces, &c.

Mr. ROBERT ADAMS, Great Dover Street, had on view his patent anti-accident reversible and sliding window. The sashes of the window have the usual vertical movement; but, in addition to sliding up and down, they also turn on a pivot, and can instantly be changed from sliding to swinging sashes. This arrangement, among other advantages, affords security for life and limb in window cleaning. The chance of accidents in getting with difficulty at the outer face of the glass is done away with. By a simple revolution the sash reclines within the room, the outer face being thus presented to the hand of the attendant to clean. By the patent sash bolt, the windows after being opened a few inches can be fastened so that they can neither be opened further or shut by any intruder or would-be intruder. The lower sash may be opened a few inches, and the ventilating bar used. The ventilating bar, usually 3 inches wide, and hinged to the sill, is lifted, the bottom sash closed upon it and fastened by the sash bolt; it then leaves an aperture between the upper and lower portions of top and bottom sashes, through which a current of air passes into the room, to produce ventilation without draught. Mr. ADAMS also showed, among other of his patents, the fanlight-opener, compensating spring hinge with adjustable shoe and top centre, door spring, and slam check for public doors, locks, and lock furniture. The new panic door for theatres or public buildings is intended to open a way out at a moment's notice in case of fire or panic. As seen in the model, by turning a handle or bolt the door is carried up out of sight just as quickly as a carriage blind when the spring is touched. A wide doorway opens in an instant, and the question of doors opening outwards or inwards is avoided.

The model of a house was used by Messrs. C. KITE & Co., Euston Road, to illustrate various systems of ventilation. The patent exhaust-roof ventilators comprised plain and ornamental ridge ventilators, dormer and turret-ventilators. They are in use at various business houses, schools, churches, besides being used extensively by the Admiralty, and are also used to meet the minor requirements for ventilation of shop fronts, &c.

The system of thorough ventilation of dwelling-rooms was shown, as being effected by chimney breast-ventilators constructed on the principle of the exhaust-roof ventilator. These are inserted near the ceiling of an apartment, to carry off the vitiated air into the chimney flue. They have no loose parts, are noiseless, and are said to prove the remedy for smoky chimneys. The improved inlet and outlet drain-ventilators received a prize medal at the Sanitary Exhibition at Eastbourne, and have been adopted at Brighton, Torquay, and other towns. Smoke-curing chimney-caps have also been extensively patronised.

Messrs. UNDERHILL & Co., Upper Thames Street, manufacturers of stoves and kitcheners, &c., and chimneypieces of marble, slate, and woods of various kinds had on exhibition the "Eureka" slow combustion tile grate with cast-iron "Adams" chimneypiece and tile hearth.

The Victoria Stone Company's (Kingsland Road, N.) wares were supported by samples of the patent Victoria stone paving, taken from Upper Street, Islington, where it had done duty for eleven years. The material is used for the production of sinks, gutters, gullies, copings, &c., as well as pavements.

Messrs. HOWARD & Co., Berners Street, W., fitted up a compartment with wood tapestry. This can be fixed to any plastered wall in lieu of painting. The parquet flooring is much appreciated for its promotion of cleanliness; it affords no harbour for the lodgment of dust and dirt, and is washable.

PARIS NOTES.

THE great Church of the Sacred Heart, now in course of construction on the lofty heights of Montmartre, is at the present season being visited by thousands of persons daily, numerous expeditions, which the French dignify by the name of pilgrimages, having been organised from nearly every parish in Paris and around, for the purpose of inspecting the progress of this great religious undertaking. After the services that are held every day in the temporary chapel, the congregation forms into procession and visits the work. First making the round of the entire edifice, the *cortège* enters the main body of the church, and truly curious but at the same time imposing is the view of the long procession with crosses and banners at their head, wending in and out of the wilderness of scaffold beams, amid the grinding noise of the material, waggons, and the shrill whistles of the steam-engines. The crypt of the building, which is entirely freed from scaffolding, may now be seen throughout, and its grand proportions serve to give some idea of the scale upon which the future cathedral is designed. A chapel, devoted to the offering of prayers for the dead, has already been opened here in the middle of the great nave, exactly under the spot where it is intended to erect the high altar of the upper church. The outline of the main building, which twelve months ago was scarcely commenced, is now taking form; the side walls are built to about half their height, and before the end of the year it is hoped to bring them up to the spring of the vault. The six first courses of the circumference of the choir are finished, while the second course of the apsidal side chapels is being placed. At the other end of the church the double porch preceding the principal entrance is already covered in, and the latter will be next begun. The financial prospects of the work were never brighter than at the present time, the subscriptions received during April having amounted to 126,964 frs. 48 c., against an average sum of 92,000 frs. received in the corresponding month of the ten previous years. The total amount collected up to the present reaches 12,500,000 frs., of which 11,700,000 frs. have been expended, leaving in hand an available balance of about 800,000 frs.

The front of the central block of the Tuileries Palace, generally known as the Pavillon de l'Horloge, facing the Place du Carrousel, is now almost entirely demolished. The small marble columns which formed the principal decoration of this façade were lowered one by one, after being carefully wrapped in straw, &c., as also were the capitals and cornices that could be detached without breaking, and all of these have been claimed by the representatives of the State. On the Gardens side a scaffolding is now being erected specially for the removing the architectural carvings and designs which in this part of the building have, for the most part, been spared by the flames.

The Louvre has just received the donation of several pic-

tures from the collection of M. Coutan, among them being *La Chapelle Sixtine*, by Ingres; a *Crucifixion* and the *Marriage of Napoleon I. and Marie-Louise* by Prudhon; two works by Géricault, and a number of drawings by Ingres.

At the Hôtel des Ventes last week the chief sale was that of the collection formed by M. Lefranc, a nephew of the celebrated Madame Vigée Le Brun. A *Portrait of Madame Dubarry*, by Madame Le Brun, realised 3,500 frs.; another by the same artist, representing *Lady Hamilton en Bacchante*, fetched 1,150 frs.; an *Allegorical Composition*, by Fragonard, 4,150 frs.; and a *Portrait of Queen Marie Antoinette*, by Madame Le Brun, 3,500 frs.

The prize lately founded by the Duchesse de Cambacérès has this year, the first of its distribution, been awarded as follows: 1,000 frs. to the second Grand Prix de Rome in painting; 1,000 frs. to the second Grand Prix de Rome in sculpture, and 1,000 frs. to the Grand Prix de Rome in medallion and copper-plate engraving.

A number of ceramic painters, including MM. Léon Parvillée, Achille Parvillée, Marthe Lapointe, Anne Tirard, E. Adler, Weissmann, M. Bernau, Delaunay, J. Lapointe, B. Legrand, M. Abbott, C. Galland, J. de Fermon, B. Rollot, A. Riottot, &c., have memorialised the Salon Committee to have three representatives of their special branch of art added to the ordinary jury, for the purpose of judging paintings on porcelain, stained glass, and enamels, and awarding prizes if merited. They contend that their work constitutes a speciality that requires as such a special jury, and, further, that the admission of their productions to the Salon is useless unless it be consecrated by rewards.

The International Exhibition of Paintings by modern artists at Georges Petit's Galleries in the Rue de Sèze closed on Sunday, and has been quickly followed by another, which opened on Tuesday, and is likely to prove highly successful, notwithstanding that it comes rather late in the Paris season. It comprises nearly two hundred and thirty works, the majority *chefs-d'œuvre* culled from the collections of various amateurs in Paris. The old masters are well represented, although three-fourths of the exhibits are by eminent painters of the present century. In the former category appear such names as those of Rembrandt, Rubens, Vandyck, Greuze, Ruysdael, Teniers, and Hobbema. The first-named contributes three—*Le Doreur*, belonging to the Duc de Morny; *A Man-at-Arms* and *A Man's Head*, lent by M. Edouard André; a single picture, *Abigail*, a large composition in which several of the figures, filling nearly the whole of the foreground, are semi-portraits, is the sole representative of Rubens. The Teniers are—*The Ham Lunch*, dated 1648, a group of peasants seated round an appetising ham in a country inn, while others are dancing and smoking near them; and *The Village Kermesse*. Other notable exhibits in this section are the full-length portrait of a lady by Vandyck—described in the catalogue as *La Femme à la Col-Jerette*; a pair by Hobbema—a *Wood* and *The Water Mill*; *A Young Girl* by Greuze, and a landscape by Ruysdael. Among the modern artists represented are such masters as Corot, Courbet, Delacroix, Descamps, Meissonier, Millet, Isabey, Rousseau, Troyon, &c. The collection as a whole will bear comparison with any similar exhibition held in Paris during the past two seasons.

The subject for this year's competition for the Prix Troyon is announced as "A team of oxen yoked to waggon, with driver on foot, descending a hollow road in the forest in early morning." The latest date fixed for the sending in of preliminary sketches is September 15, and the definitive work must be executed on a canvas 60 inches by 36 inches.

The Municipal Committees of Roads and of Fine Arts have both reported in favour of the purchase, at a cost of 12,000,000 frs., of the 7,000 mètres of ground covering the remains of the old Arènes de Lutèce, with the proviso, however, that the State will bear half the expense. These reports are sure to be acted upon by the Council, and there is thus every probability of these interesting ruins being preserved, and the space devoted to a public park.

The Commission of Historic Monuments, at a meeting held a few days ago, under the presidency of M. Antonin Proust, voted a sum of 10,000 frs. towards the work of preserving the remains found by the Père la Croix in the course of his famous excavations at Sanxay, in the department of the Vienne. It also adopted a resolution on the same subject urging the Government to purchase the land forming the scene of the Reverend Father's labours, at an estimated cost of 100,000 frs.

LOCAL EXHIBITIONS.*

BY T. WHITBURN.

THE revival of the art class under my direction suggested to me that a few observations on the educational importance of classified collections of works of art might be opportune; for if we admit that one object of the class is to develop or cultivate the taste of the students, it must be evident that exhibitions of works of art may, if collected with a definite aim, be valuable aids to such development. It is with such a motive that the superb collection at South Kensington has been formed; and it is with the view of assisting the students here in acquiring a knowledge of the methods and principles of design that I have brought together some examples illustrating my own former course of study, a few of which I am about to use in elucidation of my preliminary remarks. The remainder, when arranged, I shall at some future time be happy to submit to your inspection. It often happens that in the endeavour to obtain knowledge both time and energy are wasted ere the right path is discovered. The road to error is notoriously smooth and easy—that to truth appears both narrow and difficult. The system, however, which I adopted when a learner was this: I studied abstract form where alone it is to be found in perfection, namely, in the best works of the best antique sculptors; structural form, as demonstrated in anatomical schools and museums; and vital power and varied action in the living beings themselves. That this course of study can only be perfectly carried out in a metropolis is evident, but the principle actuating it may, to some extent, be pursued everywhere. Now, art in its earliest phases was either symbolical—that is, indicative of abstract ideas, such as majesty, grace, beauty—or illustrative of historical events, and thus a substitute for writing, as in Egypt. This early art, therefore, was not what we term imitative. The intention was not "art for art's sake," but art for the sake of some idea capable of being expressed by art; and, when working under this condition, art is termed conventional. This quality, we find, is eminently characteristic of the art of ancient Egypt. Let me offer, as an example, a sketch from a lion of red granite, now in the British Museum. This, inscribed with the name of Amunoph III., better known as Memnon, and whose so-called vocal statue was considered one of the wonders of the world, was executed at least 3,300 years ago, shortly after the death of Moses, when the memory of the events connected with the Exodus was fresh in men's minds—when Egypt seemed at the summit of power, wisdom, and glory—when our British predecessors, clad in skins and huddled together in caves, contended with wild beasts for existence. Here we see that leonine characteristics are made to subserve an architectural purpose. The lines indicating the form are simple and, as it is termed, "severe." There is no attempt to represent with fidelity hair or claw. Even the mane is indicated merely by a circular line. Yet the effect—of course I refer to the original work, despite its mutilated condition—is eminently grand and impressive. Let us next turn to a sketch of a lion seizing a fawn, from one of a number of bas-reliefs in the British Museum, brought by Sir Charles Fellows, in 1844, from that part of Asia Minor anciently known as Lycia. These works come nearer to our time by about a thousand years, having been executed some 2,300 years ago, soon after the epoch when Homer told "the tale of Troy divine," and it illustrates in a very spirited manner one of the bard's favourite similes when he wished to emphasise his description of a hero's prowess, by a lion springing suddenly on his prey. Here, instead of repose, as in the former example, we have violent and skilfully-expressed muscular action, yet the treatment is still, in a degree, conventional. Thus the mane is not allowed to interfere with the line of the shoulder, but is cut off in a manner which would certainly not be seen in nature. But in this copy of a lion drawn by Rubens, now in the collection at the British Museum, we find not merely magnificent general form, but imitative accuracy of detail. Here, if we see idealism of strength and ferocity, we perceive also a realistic representation of those adjuncts on which leonine strength and ferocity seem to us to depend. In a word, this is not sculptural and conventional, but imitative and pictorial art. The sketch at the side was from a living lion in the Zoological Gardens.

Similar differences may also be remarked between the figures of the eagle as represented in the Roman sculpture at the British Museum, and the living bird in the Zoological Gardens. You will perceive from these sketches that there is a peculiarly symmetrical arrangement of feathers in the former which is of quite another kind from that in the latter. Nor is conventional treatment in art confined to figures. Even in landscape we find among the early masters subordination of character of line to the pervading sentiment of the picture, and this elimination of a supposed incongruous element is, in some cases, termed purism. For example, in this sepia copy of a portion of a landscape background in a picture representing the *Virgin and Child* in the National Gallery, by Pietro Perugino, the master of Raphael, who flourished in the fifteenth century, we see that with much sweetness of feeling is combined an arrangement of lines in the trunks and limbs of the trees which

* A lecture delivered at Guildford on May 22.

could not be found in nature; and this departure from literal imitation, or from realism, proceeded not from ignorance or unskilfulness, but from the determination on the part of the artist that the lines of the landscape should harmonise with those in the other parts of the picture. Raphael, too, in his early works followed the same conventional method; but, when he struck out a bolder style of his own, his landscape became much more realistic in manner. This change is indicated by the sketch I show from a portion of the landscape behind the figure of St. Catherine, in his picture of that saint in the National Gallery, which might almost stand for some part of the river Wey. Realism, as distinguished from idealism in landscape proper, found its first exponents in Holland; and that the founder of the English landscape school—Gainsborough—fully recognised this quality, these copies of sketches of his in the British Museum, which resemble those with which we are familiar among our Surrey lanes, heaths, and commons show.

But perhaps I have now said enough to indicate that even a small collection may be serviceable in illustrating the history of art, and imparting information respecting the manner in which natural forms have been modified in different ages to suit the ideas which it was considered desirable that art should express. Each town then should, I think, for educational purposes, possess a representative or classified collection—not a museum; for the term museum, rightly understood, is one of vast comprehensiveness. Take the British Museum, for example. Here we have, to start with, a library so enormous and expansive that it threatens to eventually swallow up all the space in the building. Next there is a splendid collection of prints and drawings, which, under the able keepership of my friend, Mr. George Reid, is yearly assuming greater completeness and importance. Then comes a gallery of sculpture, which, as regards the finest period of Greek art, that of Phidias, is certainly without an equal in the world. After these we find coins and medals, Greek and Etruscan vases, pre-historic relics, and works of the Renaissance, with fossils and such a wonderful accumulation of objects of natural history, that it has had to seek a dwelling of its own. Collections, then, and galleries form really but portions of a museum. Thus the National Gallery, the National Portrait Gallery, and even the South Kensington collections, must be considered as departments of the national museum. And the contents of all these departments, be it understood, are properly classified for study. They are not mere accumulations of things termed curiosities, but they aim at giving as complete a view as possible of the branch of art or the department of nature to which they pertain. They differ, then, materially in this respect from many very large and valuable collections, which would appear to have been gathered together mainly from the desire for accumulation. Here is a catalogue, for example, of Mr. Beckford's famed collection at Fonthill, which, when sold in 1823, took thirty-seven days to disperse, and consisted of 9,088 lots. Here is another catalogue of the equally famous collection made by Horace Walpole at Strawberry Hill, which, when sold in 1842, occupied twenty-four days, and comprised 3,592 lots. A collection, on the other hand, which did have a definite aim, and which is described in the admirably-arranged and lavishly-illustrated catalogue before you, was the one made by Mr. Roach Smith, of antiquities found in London, and pertaining to Roman, Saxon, Norman, and mediæval life in that city, and it now, I believe, forms part of the Guildhall Museum.

Both museums and collections, again, differ in one respect from exhibitions. Museums, and in a lesser degree collections, convey the idea of permanence; but an exhibition is commonly understood as a temporary display for some special purpose of objects of a special kind, which may have been gathered together merely for the occasion. Such, for example, was the first of the great provincial loan exhibitions held in this country—the one at Manchester in 1857—just twenty-six years ago. That exhibition appropriately termed, according to the catalogue, of “the art treasures of the United Kingdom,” had a convenient building erected purposely to contain it, and was open for several months. I passed a week there in order to examine the contents with care, and I can affirm that for comprehensiveness of aim and skill in arrangement it is never likely to be surpassed. It must be borne in mind, however, that this was essentially a classified art exhibition. It was neither an accumulation of curiosities, nor an exposition of industrial products, but it gave, as might be expected, pre-eminence to painting, and displayed in due relation and subordination the various developments of art akin to her. To convey some idea of the pictorial wealth of this exhibition, I will give just a few statistics. Of rare pre-Raphaelite masters there were 100 specimens, nine being by Giotto, the most famous of the early Italian painters, of whom the National Gallery only contained two. Of Raphael there were no less than 22 examples, whilst the National Gallery had but five. Titian, again, the greatest Italian colourist, was here represented by 28 pictures, the national collection had only nine, and so on in a similar ratio. The total number of pictures by the old masters here shown was 1,123, whilst, according to the National Gallery catalogue of ten years later, there were in that collection but 752. If we add to this number 689 works by modern masters, 386 portraits of various periods of the English school (a most valuable and interesting representative collection), 969 water-colours, and

59 miniatures, we have a total of 3,236 pictures, to say nothing of drawings, engravings, photographs, and works of art of other descriptions. Now I scarcely need say that it would be wildly absurd for any provincial town of merely moderate size to dream of competing with such an exhibition as this. Manchester, with boundless wealth, immense population, and unlimited credit to draw upon the art treasures of the whole kingdom, could compass it; but any average county town, in a merely rural district, should, to use a homely adage, “Cut its coat according to its cloth.” But this at least it might show, if fortunate and wise, that the coat, if not of gigantic proportions, might as regards quality of material equal any that could be exhibited even by wealthy Manchester itself. Permit me to illustrate my meaning. In a building known as 52 Pall Mall, nearly opposite to Marlborough House, there used formerly, every autumn, to be an exhibition by a society of noblemen and gentlemen of works by the old masters, lent for the time from their own collections; and this society was called “The British Institution for Promoting the Fine Arts in the United Kingdom.” It was established in the beginning of the present century, and may claim to have been the earliest art loan exhibition in the country, and the worthy parent of all that have succeeded it, the winter exhibitions of the old masters at the Royal Academy included. One feature of this institution I may mention, as it was unique. The exhibition being over, a certain number of fine works were liberally allowed by the owners to remain for students to copy. Having been a student there myself, and enjoyed the privilege on several occasions, I can speak of it from personal experience. On looking over some old catalogues of this institution (which, after flourishing for seventy years, at length developed, in accordance with some recondite law of evolution, into the Prince of Wales's Racquet Club), I remarked that on one occasion several pictures were contributed by His Grace the Duke of Northumberland; and I can say from my recollection of that exhibition, even after the lapse of more than twenty years, that among those pictures was one of such remarkable artistic value and interest that any exhibition containing it would at once be worthy of European recognition, and the most accomplished connoisseurs would not think it beneath their dignity to visit it.

Thus, to give an instance of the trouble which art judges will sometimes take to examine pictures, and verify statements respecting them, I may mention that in the year 1867 I had occasion to write a series of articles on an important artistic subject in a London paper, and these, being collected in pamphlet shape, were published by a firm with German connections. Some copies being sent to Vienna, one of them fell into the hands of the secretary to the gallery there, who understood English, and, being impressed with it, he communicated the contents to the director. This gentleman also considered the statements deserving attention, so, without loss of time, they both of them came over to London, compared my assertions with the works of which I had written, communicated with me by letter and personally in a complimentary manner, and then returned fully satisfied that the time spent in their examination had not been thrown away. Now, I don't mean to say that the director of the Vienna, or of any other European, gallery would come to this country purposely to see a provincial exhibition if it were to contain the Duke of Northumberland's picture which I spoke of, but I can confidently assert that if such a connoisseur were in London he would consider a visit to such an exhibition indispensable, if such were the only means open to him of examining that particular picture. This, then, it seems to me, is an aspect of the matter worthy of some consideration. Is it, or is it not, desirable to impress visitors to an exhibition in a country town with the idea that, though other places may be larger, wealthier, more commercially important, the one in which the exhibition is held may in taste, knowledge, culture, be equal to the best? Artistic efforts, local and provincial, are apt by those of cosmopolitan views to be regarded with something akin to contempt.

In fact, the English people generally, when they concern themselves about questions of taste, meddle, so some have asserted, with matters which they imperfectly understand. I have here a letter written to me thirty years ago by a very clever man indeed, the late Henry Drummond, then M.P. for West Surrey, and so long the worthy and generous president of the Guildford Institute, in reply to a communication of mine respecting an artistic topic which I was then discussing in the columns of the *Morning Post*, and which became a subject of Parliamentary inquiry and subsequent committee; and as this letter is interesting as bearing upon the matter before us, and is eminently characteristic of the man, I will, with your permission, read it; as follows:—

“Feb. 19, 1853.

“Sir,—I have always thought that there is so much ignorance of pictures in this country as to make it impossible for there ever to be a picture gallery which shall not sooner or later be spoiled. The sooner the English people learn to know themselves the better, for they are supremely conceited, and think they understand everything. You may depend upon my being present when the motion you speak of is made, for I am very seldom absent from the House.—I am, Sir, yours obediently,

“HENRY DRUMMOND.

“Mr. Thos. Whitburn, Guildford.”

Now this opinion of our faculty of artistic appreciation certainly does not err on the side of praise, and I can only hope that as Mr. Darwin's theory of evolution has been elaborated subsequent to Mr. Drummond's epistle, we may either have progressed since then to a higher stage of æsthetic development, or, conscious at last of our ignorance, have become possessed with a desire for improvement. One thing, at least, I feel quite sure of, namely, that from Mr. Drummond, if alive now, we should receive the heartiest and most liberal assistance in any movement calculated to advance the interests or promote the culture of this town and neighbourhood. Upon those great displays of the products of modern art and industry, the first of which astonished the world in Hyde Park in 1851, and which are termed international exhibitions, I must touch with brevity. The one held at South Kensington in 1862, of which I wrote a detailed account of every department in the columns of an important London newspaper, was noteworthy from the complete view it afforded of English pictorial art from its commencement down to the date of the exhibition. The London International exhibitions of 1871 and the two subsequent years, to which I contributed works, were intended as select displays of international art, and also, each year, of some special product of art industry. The Paris Universal Exhibition of 1878, in which I was an exhibitor with honourable mention, surpassed, as is well known, all previous efforts in magnitude and completeness. The large provincial exhibition held at York in 1879, at which I was also an exhibitor, and obtained an honourable certificate, was an attempt, and a very creditable one, to combine a display of art treasures with that of the productions of modern industry. The most recent of these important provincial exhibitions was the one last year at Worcester, which was open for three months, was visited by upwards of 200,000 persons, and produced a clear profit of 1,500*l*. Of the exhibition in our own neighbourhood, at Alton, also held last year, to which I had a courteous invitation, which I accepted, to send some works, I will only say that it was most spiritedly and judiciously carried out, and was both popular and financially successful, results which, from the skill and energy with which its promoters laboured were thoroughly deserved.

In conclusion, while thanking you for your kind attention, permit me to express a hope that although circumstances have not yet favoured our holding an art loan exhibition here, an opportunity nevertheless may be found. For I think we are quite justified in believing that there are art treasures enough in this neighbourhood to form an exhibition of an instructive and most interesting kind; that the knowledge and enterprise requisite to carry such an undertaking through may be found in our ancient and most picturesque town, and that the results of such an exhibition would be satisfactory, not only to the public who patronise such an undertaking, but to those on whom the trouble and risk necessarily fall—the committee and the promoters.

THE TENDERS FOR THE BIRKENHEAD TOWN-HALL.

AT the monthly meeting of the Birkenhead Town Council on the 6th inst., a letter was read from Mr. E. Gabbutt, contractor, again complaining of the rejection of his tender for the erection of the new town-hall, and intimating that proceedings would be taken against persons not named. In connection with this letter a resolution of the General Purposes Committee was considered, to the effect "that having carefully considered the correspondence and all the circumstances of the case, the tender of Mr. James Leslie, of Bootle, to erect the new town-hall in accordance with the drawings, specifications, and quantities prepared by Messrs. C. O. Ellison & Son for 40,497*l*. be accepted," subject to the usual conditions as to the fulfilment of the contract. Several questions were asked as to the duplicate tenders, the telegram from Mr. Leslie reducing his tender, &c., and after explanations, which were accepted as satisfactory, the resolution of the committee was adopted, Mr. Fred. Smith withdrawing a motion to refer the matter back a second time.

Reporting to the General Purposes Committee on Mr. Gabbutt's last letter, Messrs. C. O. Ellison & Son divide the subject into four parts: 1. The custom of accepting the lowest estimate for public work unless there are good reasons to the contrary. 2. The footnote upon Mr. Gabbutt's tender. 3. The works referred to by Mr. Gabbutt; and 4. The supposed difficulty in his getting quantities. They say:—

Nos. 1 and 2 must be taken together. The custom alluded to is that on which we always act, and but for the footnote Mr. Gabbutt admits putting on his tender we should have urged its acceptance, having great faith in the reputation left by his father in the trade, although we have seen Mr. Edmond, or Edward, but on the one occasion of his calling as to this work. The footnote, however, being practically an attempt to secure behind the back of all the other competitors, terms far more advantageous than those on which they had tendered, and the acceptance of which would at once have handed over to Mr. Gabbutt all the advantages we had been at so much trouble to secure for the public benefit, we at

once lost all confidence in him as the contractor for the proposed work, and in common fairness to the others recommended the adoption of the next lowest tender sent in upon the terms of the specification you had already approved. It may be well here to point out that during the many days the estimates were being prepared not one solitary objection was made to the terms proposed by us, all the contractors adhering thereto, with the exception only of Mr. Gabbutt, who, instead of openly raising the question then and to us, or declining to tender, as he ought if the terms were such as he now professes, preferred, whilst apparently acquiescing, to privately add a footnote to his estimate, the acceptance of which would have given him a most unfair advantage over his fellows.

Mr. Gabbutt says in his letter: "A peculiar feature of this contract is that 16,000*l*. is provided in sums to be dealt with by the architects for sundry works," as to which he is further good enough to say that in his opinion "the ratepayers of Birkenhead should have the advantage of public competition as well with regard to the 16,000*l*. as to the remainder of the estimate," the first statement being simply untrue, and the latter misleading. The fact being that the addenda to the quantities to which Mr. Gabbutt alludes only contains 14,357*l*., and that made up as follows: 8,157*l*. total of sub-tenders to which we shall again refer, 2,700*l*. set apart in the specification for the use of the committee for heating and ventilation, &c., and 3,500*l*.—not 16,000*l*., as stated by Mr. Gabbutt—"to be dealt with by the architects for sundry works." And even for these we have already had estimates, but deferred closing in anticipation of being able to make still better terms for our clients. As to the 8,157*l*., this is the total of the lowest estimates received by us from specialists, as many as five estimating for one thing; and that no wrong should be done to the sole contractors by our act, we sent to each a list of the lowest tenders received, giving the sub-contractors' names, and plainly marking the document as follows: "Amount of lowest estimates received by the architects for the several works required to be done in a special way, and by tradesmen, approved by them. Note: These figures being nett, the contractor must add for himself any profit he may require thereon, and include the same with sums herein in the general tender." A course which allowed each to add the same profit he would have done had the estimates been got by himself, placed all on one equal footing, and whilst securing for the building the best possible results, prevented the too common curse of open competition—viz., finding, when too late, that work requiring special means of supply, or the highest skill, is in the hands of men whose only recommendation is the lowness of the price quoted in their eagerness to secure the job.

No. 3.—With reference to the buildings specially referred to by Mr. Gabbutt as samples of his skill as a general contractor, we have since examined the work at the new Court Buildings, Victoria Street, and the Woodside Railway Station, but only to find that, so far as the joiners' work is concerned, it in no degree leads us to regret the decision at which you have arrived, but proves more clearly than ever the necessity of having each branch, even of the ordinary work, done by contractors whose special business it is, for it is plain that even the best of masons cannot be depended upon for joiners' work, the defects of which in many cases—and doubtless in those referred to—do not develop themselves until after the architects have passed the work, but follow too surely on everyday use.

No. 4.—Another statement of Mr. Gabbutt's is that he had some difficulty in obtaining the quantities, and in apparent support thereof he takes the unusual course of sending to the Council a copy of a letter received from us, not asking permission so to use the letter, but forgetting (?) to send also copy of the following, which shows how imaginary was the difficulty of which he complains: "Dale Street, March 28, 1883. Birkenhead quantities are now ready, and can be had and plans seen here at any time."

Having now dealt with Mr. Gabbutt's letter to the Mayor, we would willingly close our remarks, but as from the press reports of the last Council proceedings it is very evident letters were also sent to some members of the Council, containing statements which were made use of, although finding no place in the Mayor's communication, we beg permission to refer to the question of "duplicate tenders." On this, as on all the other points, we are quite sure that, if fairly looked at, our action is not even open to doubt. Had we actually occupied the position of "architects to the municipality," to which, according to the referee's report (August 30, 1882), and adopted by the Council, we should become entitled on the verification of our estimates, even then we should not have violated any professional law or rule by asking to have copies of the tenders sent to us at the same time they were sent to our clients (see editorial remarks on this case in the London *Architect*, May 5, copy sent herewith). It must, however, be remembered, that we are not yet officially appointed to the position we have now fully earned, and that our right thereto depended entirely upon the estimates in question; consequently, whilst carefully guarding our interests, it was only to be expected we should also protect our own by asking for copies of the tenders to be sent to us, so that if the amount was above the 42,000*l*. stipulated, we could at once point out how and where reductions could be legitimately made to bring the cost below this figure, instead of waiting,

and for want of this ordinary precaution finding ourselves perchance voted out as not complying with the terms of the competition.

Further, as to duplicate tenders, objection was raised by one only out of eleven contractors, and with four only we have previously done business, giving additional strength to the following remarks by the editor of *The Architect*, viz.: "The fact that the majority of the intending competitors were willing to furnish copies shows that they believed they were running no risks," and that such was the case will be apparent when we tell you that when the tenders were opened by the committee we had not received more than six or seven copies, some not coming until the following day's post.

THE ARCHITECTURAL COMMISSIONS OF THE BIRMINGHAM SCHOOL BOARD.

A MEETING of the School Board of Birmingham was held on the 7th inst., when the report of the Sites, Buildings, and Repairs Committee was submitted. It stated that the committee had had under consideration the present arrangements under which the services of the architects to the Board are rendered, and seeing that the Board had erected schools more rapidly than was anticipated at the time that this arrangement was made, they recommended "that whenever the value of the buildings paid for by the Board, and entrusted to them, exceeds 5,000*l.* in one year, then the architects shall receive a commission of 2½ per cent. on such excess; this resolution to apply only to such work as may be undertaken subsequent to this date; and that this agreement be subject to three months' notice on either side." They further recommended that that part of the minute directing the architects to report upon the condition of the school buildings twice in the year be rescinded, and the following be substituted in place thereof: "That the clerk of the works be required to report regularly to the architects upon the condition of the existing schools, so that every school is reported upon at least once a year; that the architects be requested to bring before the committee the results of their examination of these reports." The committee reported that the Education Department has approved the purchase of the proposed site in the St. Andrew's Road, and they now recommended that they be authorised to obtain the necessary plans and specification for the erection of a school for 1,000 children on the said site.

Mr. Kenrick explained that the existing agreement with the architects was made in 1880. Under its provisions the architects received no commission, but a salary of 250*l.* per annum. At the time it was made a very moderate and uniform erection of schools was anticipated, but the anticipation had been exceeded by the event, and it was obviously necessary that some fresh arrangement should be come to with the architects. By the proposed changes, if one school were erected every two years, the salary paid to them would be precisely the same as at present. If, however, more than one was erected, they would be in an unduly advantageous position, because they would obtain the services of the architect at 2½ per cent. commission, only half the usual rate, and the services of architects second, he thought, to none in the town.

Mr. Hawkes asked the Board to consider whether they ought not to refuse to make the proposed increase, and put a period to the contract which the late Board entered into with Messrs. Martin & Chamberlain. During the last ten or eleven years thirty schools had been built by the Board, at a cost of something like 14,000*l.* or 15,000*l.* per school, and they might look forward to an immediate further expenditure of about 45,000*l.* Looking at the fact that one firm of architects had for eleven years been employed by the Board, he had an unconquerable objection to the Board's continuing its patronage of that firm. The practice excluded from the service of the town many members of a profession of the highest respectability. Anything like monopoly as opposed to fair trade was utterly odious to him. Every member of a trade or profession ought to be given an equal right to competition as long as he was a citizen. Monopoly was still more shamefully objectionable when it was coloured with a political aspect. That there were other capable architects was manifest on looking at the Council House and Mason College. It was not necessary for the erection of more schools that they should have the magic wand of Mr. J. H. Chamberlain. The existing schools impressed him with a sense of grim monotony, representing a gloomy craze. The Board might build another thirty of the same leaden, or he might say clayey aspect, but he did not hope to live to see it. He urged the Board to inaugurate a reign of justice with respect to the question of architecture. He knew something of the working men of Birmingham, though he was not professionally connected with them; and he knew that they were filled with the spirit of fair play, and that the present monopoly was as odious to them as to himself.

Mr. Greening reminded the Board that when the present arrangement with the architects was made, the proposal to throw open the matter to public competition was before the Board, and the arrangement was made almost by way of a compromise. The Board willingly accepted the arrangement, because they thought that the architects had been very largely paid before. He hoped

the Board would hesitate before it attempted to alter the present arrangement.

Mr. C. Wallis expressed surprise at the statement which had been made, that as soon as they began to build schools the present arrangement was proposed to be altered. Since the present arrangement had been made, three years ago, there had been three new sets of buildings erected which at the time were not contemplated. As a member of the Finance Committee, he was deeply interested in the carrying out of the work of the Board at the lowest possible figure; but, at the same time, he had a strong objection to receive from any architects or other professional men work for which a fair remuneration could not be paid. Messrs. Martin & Chamberlain had received during the last three years 750*l.*, and he thought he was right in saying that there was not an architect in the town who would regard that as paying the actual cost out of pocket with regard to the four buildings which were or would be erected before the three years' salary became due. As soon as it was felt that an injustice was being done, then was the proper time to rectify it. He had felt that such an injustice was being done to the architects, underpaid as they now were, and upon that ground he would second the resolution.

The Rev. R. B. Burges said that at the time the former resolution was passed he felt that the sum proposed would not at all recoup the architects for the expense they would be put to. He was astounded at the resolution being proposed, and was unable to realise how it could be supposed that the architects would be able to do the work required, and at the same time inspect all the other schools for 250*l.* a year. He had his views about the matter at the time, and they had since been confirmed. Mr. W. J. Davis, the representative of the working-classes, felt most strongly the injustice of the work of the School Board being left to one firm of architects, and was anxious that the plans for the buildings should be thrown open to competition, so that every architect in the town might have a chance of earning something out of the rates to which he contributed. He (Mr. Burges) thought that course would have been agreed upon, but the chairman of the Sites and Buildings Committee got up and proposed the astounding amendment that the architects should have 250*l.* a year for the future. When, however, it was considered that some of the schools cost 23,000*l.*, upon which outlay 5 per cent. might be reckoned, and that 1½ per cent. was allowed for getting out quantities, he began to think that, after all, the payment to the architects was not so unjust. The best and fairest way to meet the difficulty which existed was to withdraw the whole thing from one firm, and let it remain open for competition.

Dr. Crosskey said that at the time the arrangement was made he did not think that there would be such a rapid increase in the work of building. With respect to the way the architects had been paid during the last three years, he would call attention to the fact that during that period they had been engaged in business to the extent of upwards of 40,000*l.*, and whilst the ordinary payment for that to an architect would have been 2,000*l.*, the Board had only paid 750*l.* Now that it was proposed to build on a large scale the present proposal was extremely liberal, and he did not believe it could be done as cheaply by putting it out to any other firm. The more general question as to whether or not it should be open to competition, should be looked at entirely with respect to the interests of the public and to the interests of the scholars. In considering that question he could not accept the position of Mr. Burges. He (Dr. Crosskey) did not think it was his duty, as a member of the Board, to consider how to distribute the rates, and give people the opportunity of getting plunder—or, rather, payment—out of the rates; but, rather, that his duty was to endeavour to get the best possible work done in the best possible way at the cheapest rate. The principle suggested was that every competent architect should be allowed to compete; but if such a course was adopted the Board would have to engage experts who were competent to judge, to decide upon the best design, and so forth, so that an increased expenditure would be incurred. It was better, too, for the Board, from an educational point of view, to have one firm of architects.

Rev. T. J. Haworth said he should always vote for the plans being thrown open to competition, as it might introduce modern ideas into their buildings in very many respects.

Canon Longman said that there was a fair agreement made with the architects, and no doubt they had had some disadvantages, but the advantages and disadvantages should be put one against the other, and he should therefore oppose any addition to their present remuneration.

The Rev. E. F. M. MacCarthy pointed out that the first Board were responsible for the course taken in the appointment of the architects.

Mr. G. H. Kenrick proposed the alteration recommended by the committee in the minute relating to the architect's reports on the condition of the school buildings. He explained that this resolution was rather an alteration of words than actual results. The Board had asked for a report every six months, and that was meant to include a personal examination by the architect of every school twice a year. That was done one year if not two, but it had been found that it was not necessary, and that the kind of report indicated in the present resolution would be better suited

to their requirements, while it would also save the time of the committee. Mr. Greening seconded the resolution, and it was carried.

Mr. Kenrick then moved: "That the committee be authorised to obtain plans and specifications for a school to be erected on the site in St. Andrew's Road, to accommodate 1,000 children." The site, he explained, was now ready, and he urged the Board to proceed with the erection of the school without delay, especially as it would be at least a year before it could be opened.

Dr. Langford seconded the resolution.

Mr. Hawkes said he should vote against the resolution, not only on the ground that having erected about thirty schools they might now stop for a time, but because he saw it was intended by the Board to begin the second thirty of those schools by the aid of their present eminent architects, and also because the other architects of Birmingham, eminent in their profession, were absolutely excluded from all opportunities of competing in the preparation of designs for the schools. He had been told that it was the Board's way of showing their gratitude to the architects in not proposing to consider whether they should terminate their engagements. The architects, however, did not come to the Board for gratitude; they came for pounds, shillings, and pence, and the Board paid them; and, having paid them and got a receipt in full, they were no more bound to go to them for designs for their next school than they were to go to the same butcher for the next leg of mutton. If gratitude was to be paid them as well as money, he wondered what percentage was to be taken off the gratitude. If Mr. Kenrick would alter his resolution to the effect that the Sites and Buildings Committee should be authorised to obtain from six architects, to be selected by the committee, such plans to be laid before the committee before the October meeting of the Board, he would support it. If they could limit the competition, and have the plans brought in by October, or Christmas, or Christmas five years hence (for it was time the ratepayers had a little breathing time), he thought they would be then in a better position to judge whether their contract with Messrs. Martin & Chamberlain should be continued or not. One of those architects was supposed to be almost inspired, and if they selected six more they might get some more saints in Birmingham. In conclusion, he said he should not move his amendment, "That designs, plans, and estimates for the proposed schools in St. Andrew's district be invited from six firms of architects, to be selected by the Sites, Buildings, and Repairs Committee," but should vote against the resolution.

The Chairman said he could not attend the last meeting of the Sites and Buildings Committee, and suggested that the matter should be referred back to the committee to consider the desirability of adding to that new school a store room, which might be used as a workshop for giving instruction in technical education. He pointed out that that instruction would be given after school hours, the same as the cookery lessons, and would not interfere with the ordinary preparation for the standard examinations.

Mr. Greening hoped a debate would be raised whenever it was proposed to build schools without throwing the plans open to competition. Several of the present schools were the ugliest architectural excrescences it was possible to erect with bricks and mortar.

After some further conversation, the resolution was carried by 9 votes to 5.

A GERMAN IDEA OF A MONUMENT.

IT is proposed to erect in Frankfort a memorial of Arthur Schopenhauer, the German metaphysician, and the following suggestions have been addressed to the committee by Professor Noiré:—

Every monument has a double purpose—it must represent something, and it must at the same time signify something. An artist has to combine these two objects. What is common and ephemeral must be melted down in the fire of the artist's genius, but he must not, on the other side, allow himself to be carried away by conventional generalities or by academical phrases. Thus only can a monument, as a work of art, avoid becoming insignificant or even ridiculous, as imparting permanency to what is worthless and purposeless. A warning example of the former kind would be a representation of the great mind of Kant as an academic teacher; of the latter, a monument of Goethe in classical attire and holding a lyre.

In order to raise and intensify its significance, plastic art may claim the assistance of ideas—that is, it may to a certain extent become symbolical. The Greeks employed this symbolism with great caution, and generally in cases only where it was sanctioned by religious tradition or poetical myths—namely, in the images of their gods, these being themselves ideal forms, sprung from an idea. The great masters never forgot that their works were to be seen, and not to be meditated on. How much our own reflecting age has sinned on this point is too well known. Luther, who lifts his great book as if it were to be sold by auction, Balde touching the Horatian lyre, can hardly be called embodiments of thoughts; they have simply become a rebus. Most offensive is the amalgamation of modern realism with classical symbolism. An Olympian

athlete, with his wreath of victory, or a Victory throwing her triumphal wreaths, are beautiful and noble. A Schiller and Goethe carrying a load of garlands are intolerable, however large the number of such monuments in Germany. Augustus or Trajan, haranguing their soldiers, are dignified and great. Frederick William IV., as a Roman Emperor, is one of the saddest aberrations of taste.

I have seldom felt this contradiction more keenly than when examining a few days ago the grand monument of Cavour at Turin. The spectator recognises the great statesman, with his clever and thoroughly modern face, boots and all, thoroughly true. But what in all the world has that half-naked and classically-draped poor woman to do there, kneeling before him, clinging to him, and offering him a crown? If we are told that she represents Italy, and that on a piece of paper which Cavour holds in his left hand are written the words, "*Libera Chiesa in libero Stato*," we are hardly wiser. We cannot see how the two can form one whole, so as to appeal or speak to us; and we write in our note-book: "*Desinit in mulierem formosam vir catus et strenuus superne*." Unity—material and spiritual unity—this is the alpha and omega of all plastic art. A collection of historical and allegorical figures on pedestals, as we see them in the Luther monument at Worms, is nothing more than a collection. But a collection never expresses an idea, because its unity is not organic, but accidental only, while a monument must always be the living expression of an idea. A real master-work, uniting all significant elements into one idea, is the monument of Frederick the Great at Berlin. It is built up almost organically, and thus produces the most powerful impression. If I must take exception, it is the subordinate position which the artist has assigned to Kant and Lessing. These heroes of thought stood in the very brunt of battle, and have gained victories, the memory and the continued effects of which will never vanish. Besides, that Kant was allowed to speak and to write with perfect freedom was due entirely to what is one of the rarest events in history—a philosopher occupying a throne. Kant, therefore, is in reality one of the greatest glories of the man on horseback on the top of the monument.

If the monument of Frederick the Great shows us in the most perfect way how a number of significant elements can be united and represented as one great idea, Blücher's monument at Berlin is an excellent specimen of how the person of a hero can be represented as something truly significant.

Let us apply this to Schopenhauer. With a statesman, with a soldier, even with an artist, his figure possesses a certain importance, it may become significant and eloquent. With a philosopher, his head is the only thing that is important—the only home of his genius; and Schopenhauer himself insisted on making the bust only the image of every great thinker. Heads like those of Kant, Schiller, and Schopenhauer, however, cannot be represented except in colossal dimensions. In them, as in the head of Beethoven, there lived and moved a new ideal world, while their bodies, like that of Prometheus, were fettered by the miserable conditions of their earthly existence. Such a head in white marble should rest on a pedestal of hardest stone.

What is to be symbolical in the monument must be arranged round the pedestal; and as the monument is to represent deeds of the spirit, which cannot be represented directly to the eye, it is impossible to do without symbolical ornamentation.

It is well known that Schopenhauer was the connecting link between two worlds—between the philosophies of the East and the West, which, before him, knew nothing of each other, but sought the solution of the highest problems each in its own way. How profoundly the riddles of existence were treated by the ancient philosophy of the Upanishads was never known before Schopenhauer, though since his time other scholars, and particularly Max Müller, have made it known to the whole of Europe. The wisdom of the Upanishads, however, receives a deeper significance and a brighter light through Schopenhauer, a philosopher whose true home may be said to have been on the sacred shores of the Ganges, and who transferred the scientific principles of the West to the philosophic intuitions of the East.

It will be readily admitted, therefore, that on each side of the pedestal there should be the sitting figures of Oriental and Occidental Philosophy. Artists could not wish for a more graceful subject. Each figure must have its own character and individuality. The figure representing Occidental Philosophy should be represented as holding a looking-glass, to indicate its distinguishing character—namely, observation of the outer world. On a scroll in her hand should be inscribed the names of Plato, Descartes, and Kant. Her Oriental sister should stand before us with a meditative, half-dreamy countenance, representing inward contemplation and profound examination of the Self, as the solution of all problems. She ought to hold a scroll showing the names of Veda and Upanishad. Between the two, in the centre of the pedestal, there ought to stand the veiled image of Isis.

Such a monument, covered by a loggia, placed in a grove of trees in some remote and lonely spot of our beautiful Frankfort, would unite a deep significance with wealth of form, and rouse in the minds of passers-by solemn feelings and thoughts not unworthy of one of the most powerful thinkers of our age.

NOTES AND COMMENTS.

MR. R. P. PULLAN has brought out a most interesting collection of "The Architectural Designs of WILLIAM BURGESS, A.R.A." It contains seventy-six plates, of which thirty-eight have not been published hitherto. They include nearly all the works on which Mr. BURGESS had been engaged—such as Cardiff Castle, Cork Cathedral, Studley Church, and the Dover Town Hall, besides memorable designs which were not successful. Among the latter are the New Law Courts, London, Edinburgh Cathedral, and the Memorial Church, Constantinople. The collection, as Mr. PULLAN says, affords evidence of Mr. BURGESS' marvellous powers of adapting Gothic architecture to the requirements of everyday life, without altering or degrading its characteristic features.

THERE was a renewal of the discussion at last week's meeting of the London School Board on the subject of tenders. The resolution debated was as follows: "That the present system of letting contracts be abolished; and that on the conclusion of existing agreements, before any fresh contracts are entered into, at least ten days' public notice shall be given inviting tenders; and the Board shall require sufficient security for the due performance of such contracts." It is well known that it is only selected firms who are allowed to compete for the erection of the schools, and it was said in the course of the debate that 333 schools for the Board had been divided among twenty-one firms. The resolution was negatived, twenty-seven members voting against it and eighteen in favour of it. But one effect of the debate has been that henceforth a larger number of builders will be asked to tender for new buildings.

It is intended that in the tenders for the Glasgow Municipal Buildings alternative prices are to be given for masonry in Polmaise stone and in Dunmore stone. This is the result of the inquiries by a committee who have inspected the quarries where it was considered to be likely that stone suitable for the new buildings was to be obtained.

THE Central Architectural Society of Belgium has, with the support of the Belgian Government and the Brussels municipal authorities, organised a national exhibition of architecture, which will be held in the new Palais de Justice, Brussels, from September 2 to September 30 next. The exhibition comprises two sections, contemporary and retrospective. The former includes drawings which reproduce, wholly or partially, all buildings projected or constructed before 1830 (the year that Belgium became an independent kingdom), either by architects born on Belgian soil, or by foreign architects at that time residing in Belgium. In the absence of such drawings, engravings, so long as they do not form part of published works, may be exhibited. The modern section, subdivided into fourteen classes, includes the drawings of buildings projected or constructed, since 1830, by architects of Belgian nationality, or domiciled in Belgium. Foreign architects, who are members of the Society, are also at liberty to exhibit. Besides architectural drawings, sketches, and water-colours, exhibitors may send models or photographs of edifices, either projected or executed. There is no limit to the number of drawings, &c., that may be sent by an exhibitor; but they must all be mounted, put on stretchers or in frames, and bear the name or signature of the exhibitor. Further particulars may be obtained of the Secretary, M. CHARLES NEUTE, Architect, Rue Royale Sainte Marie, Brussels.

THE secretary of the Incorporated Church Building Society says that a large number of applications come before the Society in which the designs are unworthy of the high purpose for which they are intended. In many instances, the designs are prepared by architects who have had no special training and no experience to qualify them for building a church; and who have only been selected because, perhaps, they live on the spot, or happen to have a relation on the church committee. Their designs are often meretricious and extravagant, though perhaps they proposed (doubtless with an honest intention) to do the work cheaply. A good church, substantial in construction, and of plain but elegant design,

can be built as cheaply as a bad one; but it is unreasonable to expect the work to be done by an unqualified person. Church building is essentially a technical art, requiring much knowledge of the subject in order to produce a building which, in construction and adaptability, shall fulfil the requirements and expectations of the promoters of the work. The secretary states that he hears only too many complaints of churches, built within the last forty years, now requiring repair owing to the yielding of badly-constructed roofs, or to the spread of dry-rot from insufficient ventilation.

THE sum of 30,000*l.* has been offered to the Glasgow Corporation for the site of St. George's Church, which occupies a prominent position in the city. If the offer was accepted, it was proposed to remove the church and erect new buildings for commercial purposes on the site, for which it is well adapted. Some of the Corporation considered that the price, which is at the rate of 42*l.* per square yard, was too low, and that at least 40,000*l.* should be given for the land. One councillor said that the present time was not opportune for selling property, and he opposed the removal of a fine public building for the sake of a block of warehouses, which would mar the appearance of one of the finest streets in Glasgow. The arguments against the proposal prevailed. It may be stated that the local Institute of Architects has been in opposition to the removal.

THE Council of the Parkes Museum ask the aid of architects, medical doctors, and all who are interested in sanitation, in support of the museum, by becoming life members or annual members, and by encouraging others to do the same. By the deed of incorporation, the control of the museum is vested in the members, by whom the council and officers are elected at the annual general meetings. At these, or at special meetings, ample opportunity will be afforded to all for the expression of opinion. In addition to these privileges, members have the right of free admission to the museum, library, and reading-room whenever these are open, and the further right to introduce a friend. The fee for membership is 1*l.* 1*s.* per annum, or 10*l.* 10*s.* for life membership.

THE way in which architects can be victimised finds new illustrations in the projects for a post-office in Truro. Four years ago the promoters requested Mr. SYLVANUS TREVAIL to prepare designs for a building in connection with a proposed corn exchange. But as the authorities in St. Martin's-le-Grand were nearly a year considering the eligibility of the site, the committee of the corn exchange made other arrangements, and project number one fell through. The next project was for a post-office only, on the site of an inn, and afterwards this was modified in order to accommodate the inland revenue officers in the building. But the authorities possibly knew that the officers of two departments could hardly be trusted to live in amity in one building, and the scheme (by which the approach to the new cathedral was to be improved) was rejected. Mr. TREVAIL has consequently prepared three separate sets of designs, fully worked out, for the post-office, in as many different sites in the city, without receiving a farthing in acknowledgment for his services, or for the kindly feeling and trouble he has always taken in furthering any public work for the embellishment or improvement of Truro.

MR. DAVIS, the Surveyor of Works at Bath, must be an enthusiast, or he would not be patient when some of the Town Council are delivering orations. He has undergone enormous labour in revealing the old Roman bath in the city. But there are councillors who evidently are of opinion that it ought to be again buried. There was a proposal before a late meeting to have the rubbish cleared from the bath, and, although it was carried, there was a good deal of opposition, on the ground that the Council had no right to expend money on archaeological research. But it is in a great measure for its historic interest that Bath continues to attract visitors, and the Roman and other remains have been profitably utilised heretofore. The rubbish is to be removed, but the Antiquarian Committee of the Corporation had not the courage to propose the construction of a flight of steps to the bath. It is still to be seen only under difficulties.

CORK EXHIBITION, 1883.

[INTERIOR SECTIONAL PERSPECTIVE.]

DESIGNED BY J. J. DELANEY

[J. J. DELANEY CONTRACTOR.]

ILLUSTRATIONS.

THE CORK EXHIBITION BUILDING, 1883.

WE publish this week a sectional interior perspective view of the building for the Cork Exhibition, which is to be opened on July 3.

The citizens of Cork having been disappointed in an effort to secure the holding of the National Cattle Show in their city this year, a substitute was found, on the suggestion of an alderman of the Corporation, in the project of an exhibition of a more comprehensive kind. A public meeting was called in December 1882, at which a committee was formed representative of the community without distinction of sect or party. The members have worked since then with untiring energy in maturing the scheme. But they would readily acknowledge that their success has been owing to the enthusiasm and untiring energy of Sir GEORGE ST. JOHN COLTHURST, Bart., and Mr. LUDLOW A. BEAMISH, J.P.

The preliminary work having been accomplished, the committee, on January 24, 1883, instructed their architect, Mr. ROBERT WALKER, C.E., of Cork, to prepare a design and working drawings, &c., for the necessary buildings, having due regard to economy. On February 8 the drawings, specifications, and quantities were prepared and tenders invited, and on the 15th of the same month Mr. JOHN DELANEY, builder, of Cork, was selected in open competition as contractor. Possession of the site was obtained on February 26, when the work was commenced. By the aid of the electric light the men were enabled to be employed until a late hour at night, and, although the area of the buildings exceeds three acres, it was covered in ten weeks. The work has not only been expeditiously completed, but it has been also well done, and to the satisfaction of the architect. An interesting circumstance may be mentioned here. The contractor, owing to the rapid progress he made with the work, became entitled to a sum of 20*l.* per day for twenty days; but, feeling that he had a personal interest in the success of the exhibition, he declined to claim the bonus.

The Corn Market is the site of the exhibition buildings. The hall of the Corn Exchange has been utilised as an entrance hall, in which the turnstiles are placed, forming a porch and vestibule. Cloak-rooms, secretary's and clerks' offices, &c., are provided in this building.

An arched opening, 20 feet wide and 35 feet high, leads into the great hall, which measures 188 feet by 75 feet, and consists of a nave 50 feet wide by 56 feet high, with side-aisles and galleries over, as shown in our illustration. The orchestra seen at the end of the hall, with the organ in the centre, has accommodation for 400 performers. Ample retiring-rooms are provided.

From motives of economy, the building throughout is constructed with timber. In order to secure light proportions, the minimum dimensions consistent with strength have been used. The roof trusses are semicircular, and in part consist of laminated ribs and in part lattice-girder work. The pillars which support these trusses have semicircular ribs, springing from the same height on each of the four sides, producing an excellent effect in repetition.

The great hall is completely enclosed with 1½-inch tongued sheeting, extending to the roof lights, and the orchestra is further enclosed in a similar manner, making the acoustic qualities of the building perfect. This is a very important condition, as arrangements have been made for the delivery of lectures, &c., during the period of three months which the exhibition will be open. Concerts and organ recitals will also be given.

The timbers are rough after the saw. The colours used in decoration are three only—viz., a very dark purple, by way of dado, a light French blue on the sides of the curved trusses, and all else a Bath stone colour.

The buildings surrounding the great hall are on the same level, there being no step anywhere over the three and a quarter acres. They consist of thirteen avenues, each 384 feet long, 25 feet wide, and 30 feet high, all opening into each other, and being separated only by pillars. The arches before described are continued throughout these buildings, and they contribute to the ever-varying kaleidoscopic effect produced in the perspective by walking through the avenues.

The art gallery possesses the features necessary to insure a steady light free from shadows and glare.

Dining-rooms, kitchen, refreshment bars, reading-rooms,

smoking-rooms, lavatories, post, telegraph, telephone, and money-order offices are provided.

The space has been allotted by the committee, whose task is rendered difficult by the demand being greater than the supply. At the meeting of the executive committee, which was held last week, arrangements were made for the erection of an additional building, which will be 250 feet long, 50 feet wide, and over 30 feet high. It will afford 12,500 additional square feet in space, and will be devoted chiefly to the agricultural implement department.

The great hall is imposing, and the accommodation for the goods of the 1,000 exhibitors from all parts of the world as to light and spacing is all that could reasonably be desired.

Section A contains mineral, vegetable, and animal raw materials and their immediate products.

Section B.—Machinery, tools, machinery in motion, railway and tramway plant, agricultural and horticultural implements, &c.

Section D.—Vitreous, ceramic, glass, and pottery manufactures.

Section E.—Manufactures from skins and other parts of animals.

Section F.—Manufactures from vegetable and animal fibres, spun, wove, felted, and laid, such as cotton, woollen, and silk goods, carpets, tapestry, lace, paper, stationery, printing, &c.

Sections G and H.—Furniture and educational appliances, loan collection, curios, &c.

Valuable prizes will be given in many of the sections. It would be impossible to overrate the importance to Ireland of this project at the present moment, evidencing, as it does, self-reliance and energy wisely directed in a good cause, which is entitled to sympathy and support from all who have it in their power to advance the interests of the Cork Exhibition of 1883.

FRIEZE FROM THE PANTHEON, PARIS.

WE have already published the series of scenes by M. PUVIS DE CHAVANNES, illustrative of the early life of St. GENEVIÈVE. We now give the frieze which occupies the space above the panels, in which the artist has introduced several of the patron saints of France.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE twelfth and last ordinary meeting of the session was held on Monday evening, Mr. Horace Jones, president, in the chair. A letter from Sir John Monckton was read stating that he had great pleasure in offering the Institute a facsimile of the medal struck by order of the Corporation on occasion of the Queen's visit to Epping Forest. A long list of donations was also read which had been received from home and foreign friends, the donations consisting of drawings, published works, &c. It was determined that the cordial thanks of the Institute should be awarded to the donors.

It was then stated that for financial reasons the Council of the Institute had decided not to hold the annual conversazione, but they had requested the Lords and Council of Education to grant the requisite space at the South Kensington Museum, and the President and Mrs. Jones hoped to have the honour of receiving the members of the Institute there on June 28, invitations for which would be issued in due course.

New Members.

The following gentlemen were balloted for and duly elected:—
Fellows.—Mr. William Edward Jones, Bristol; Mr. Lewis Solomon, Associate, 7 Gray's Inn Square; Mr. John Louth Clement, Lowestoft; Mr. Edward James Martin, Associate, Department of Public Works, Calcutta.

Associates.—Mr. Herbert Frederick Tomalin, Northampton; Mr. Charles Turner, Lincoln's Inn Fields; Mr. Oliver Essex, Moseley, Birmingham; Mr. Francis Templeman Mew, Mitre Court, Temple; Mr. Arthur Basil Cottam, Watford; Mr. Alfred William Cross, Hastings—all these gentlemen having passed the examination in architecture.

Honorary Associate.—Mr. William Henry Corfield, M.A., M.D. (Oxon.), Mayfair.

The Royal Gold Medal.

The PRESIDENT said it was needless to enter into the history of the Royal Gold Medal, which was given by Her Majesty, and which the President of the Institute had the honour of presenting in Her Majesty's name to the nominee of the Institute. Under such circumstances it was always an honour and a pleasure to present the medal, and on the present occasion the pleasure and honour was doubled, from the fact that the recipient was a well-

esteemed and friendly associate of his own, namely, Francis Cranmer Penrose, Master of Arts, professional adviser of the Dean and Chapter of the great metropolitan cathedral of St. Paul's, and an esteemed member of their own profession. The President then proceeded to sketch Mr. Penrose's career and mentioned the principal works carried out, and labours by which that gentleman had distinguished himself, dwelling more particularly on his well-known researches in Greece, his study and exposition of the principles of Athenian architecture. Mr. Penrose had been the first to put before them in a scientific way the principles which had guided the architects in the construction of the Parthenon—studies and researches which had rendered him one of the *illuminati* of the times, and had contributed not a little to his selection for the honour of receiving the Royal Gold Medal that night. The President described Mr. Penrose as having been brought up in the vicinity of the finest of Gothic buildings, the love of which had not hindered him from prosecuting his researches in classic Greece. He pointed out how he had distinguished himself at Cambridge, as also in contests between Oxford and Cambridge on the Thames, on two of which occasions Cambridge had been victorious. After enumerating the chief literary works of Mr. Penrose, he referred to others, and among them to that gentleman's papers on the question of the decoration of St. Paul's Cathedral, and spoke of the improvements effected both inside and outside the cathedral under his superintendence—of the beautiful curved lines of the steps, which were a happy adaptation of his discoveries at Athens, of Paul's Cross, &c. The President said he must speak personally of the industrious care exercised in regard of St. Paul's, as also in matters of church restoration, Mr. Penrose's desire being to preserve and restore rather than introduce fancy work of his own. The President concluded his address with a reference to Mr. Penrose's skill with brush and pencil, who, he said, when the day was spent, would seek fresh fields of study in astronomy.

The PRESIDENT then presented Mr. Penrose with the medal.

Mr. PENROSE, in replying, said that the greatest honour a person could receive in his professional work was that which he received at the hands of his colleagues and contemporaries, and those who had known him for years. The honour which had been done him by the Institute in the award of the Royal Gold Medal was enhanced by the kind and flattering terms in which the President had intimated it that evening. It was no small matter to be put upon the roll along with the distinguished men whose names were already on the list, and which derived fresh lustre from him who was first on the list—his friend Professor Cockerell. He extremely appreciated the honour that had been conferred upon him, and wished he had been more worthy of their kindness. His professional works, he knew, had not been on a scale to entitle him to the honour, for there were architects far more worthy of it than he was. He seemed, however, to have been invested with a representative position in regard to Greek architecture; and on these grounds he considered some remarks on the subject would be expected of him. He had, Mr. Penrose said, lighted on an unworked mine in Greece, one laid by Mr. Pennethorne, through whom he first had heard a rumour of those refinements which were so remarkable in Greek architecture. His work on the principles of Athenian architecture, which had been referred to, was published by the Dilettanti Society more than thirty years ago—a society which was still thriving. He had had many evidences of the favourable reception of the work, especially in the one quoted by the President from Mr. Fergusson. Abroad also, as well as in England, had the work been referred to with satisfaction. Mr. Watkiss Lloyd also had founded some extremely valuable theories on the proportions of the Attic temple, so he trusted the work had not been altogether devoid of the merit the President's kindness had put upon it. This, he believed, had been the guiding principle that dictated the honour that had been conferred upon him, and what the President had said confirmed him in that view. As successor of Sir Christopher Wren, and more lately of Professor Cockerell, he had felt it to be a great honour. As to their relations with Greek principles in these days, he wished first of all to assert one point, of which there were the germs in the President's address, that he was by no means exclusive in regard of Greek architecture. A man who could see only one style was imperfect as regarded architecture, for there was a central element in art which was quite independent of any style. In Greek architecture, as also in Egyptian, Romanesque, especially in Early Gothic, and, though much obscured, in later Roman and later Gothic, there was visible a central idea in architecture, just as most languages have but one root. What was important was to know how in these days we should treat such principles. Love of the Parthenon by no means excluded love of Lincoln and Salisbury, though it might make us fantastic with such works as Henry VII.'s chapel at Westminster, but the same feeling would make one equally, and more, fantastic towards the degenerate work of Baalbec and Spalatro. The true work of the architect was with the business of the day, and he should endeavour, from a study of the principles derived from antiquity, to improve on what he had to do to-day, but very seldom to copy detail from the ancients. Measurement and examination of ancient buildings there should be, because by it one could only arrive at a true understanding of the work in question. At the beginning of the

century only Greek work would go down, and many incongruous buildings testified to the incongruous selection. But the conclusive answer to any such imperfect feeling as that Greek architecture had been tried and found wanting, and was therefore no longer wanted, was he felt found in the presentation of this medal to him, understanding himself to be in some degree the exponent of that architecture. One must, in architecture, go to the fountain-head, and the works which were really the fountain-head of architecture should be studied, and the student should economise his time by studying the finest works of accepted periods. Proportions must be studied first of all; members must be studied because of the light they threw on those proportions, but not for the sake of introducing details into our work. The kind approval bestowed on what he had done many years ago must, he thought, give a stimulus to others engaged on like works. At Athens all he had hoped for was that he might bring them something which would be worthy of their thought, but he had had no idea of such a magnificent reward. Mr. Thomas Wilson, his collaborateur, without whose assistance the work could not have been done, shared his similarity of thought as to the perfect compatibility of Gothic and Classic style. He had come from the immediate precincts of Lincoln Cathedral, the finest Gothic work, he considered, in this country, and he had not been disappointed with the Parthenon.

Mr. EWAN CHRISTIAN said that the steps at St. Paul's Cathedral, so properly spoken of by the President, formed, to his mind, with their delicate lines, one of the most beautiful flights of steps he was acquainted with. But in addition to this he wished to say a word as to the reverential care with which Mr. Penrose had laboured to bring to perfection the work of the great master, Sir Christopher Wren. Mr. Penrose deserved their gratitude not only for his work on the table—"Principles of Athenian Architecture"—but for the practical results he had exhibited in dealing with that great metropolitan building.

Medals and Prizes.

The President then proceeded to distribute the medals, prizes, &c., as follows:—

In the Pugin Travelling Studentship: the Sharpe Prize, awarded to Mr. Joseph Gibbons Sankey; certificate of honour and five guineas, awarded to Mr. Henry Hardy Kemp; and certificate of honour, awarded to Mr. Charles Aubrey Bassett-Smith.

In the Tite Prize, which is not awarded this year, an honorarium of 10*l.* was presented to Mr. John Wallace, Mr. Hubert Alfred Gregg, and Mr. Harry Anderson Paley.

The medals and other prizes in accordance with the awards made at the special general meeting, held on March 8 last, were distributed as follows:—

The Soane Medallion, with 50*l.*, to Mr. Robert Alexander Briggs, Associate; medal of merit to Mr. Frederick Richard Lees Edwards, of Manchester; medal of merit to Mr. Edmund John Milner-Allen, Associate. The Grissell Gold Medal to Mr. Harry Anderson Paley. The Institute Silver Medal and Ten Guineas, for measured drawings, to Mr. James Strong. The Institute Silver Medal and Five Guineas, for a fine set of drawings of St. Mark's Church, Chester, to Mr. William Henry Bidlake, B.A.; certificate of honour and three guineas to Mr. A. Hemingway; certificate of honour to Mr. Harry Sirr. The Institute Silver Medal and Ten Guineas, (Essays), to Mr. Harry Sirr.

A paper was then read by Mr. R. F. Chisholm, F.R.I.B.A., Architect to the Government of Madras, of which the following is an abstract:—

The College at Baroda, Western India.

The preliminary portion of the paper was taken up with a careful vindication of the author's attempt, embodied in his design for the Baroda College, to adapt Indian architectural art and indigenous forms to the changed conditions and requirements of the present day. Like many modern architects, he said, he lacked the courage to declare the particular style of his building, but a native Guzerati writer gratified him very much by describing it as "Early Hindu," which was precisely the style he had aimed at. Some arguments and illustrations followed with a view of rectifying a too prevalent impression that most of the better sort of civil architecture in India is Mohammedan, because it arose under Mohammedan influences, and from the clever way in which the Mohammedans made use of the Hindu workmen and adopted their forms in building the mosques. Many of the geometrical patterns which passed for Mohammedan were really Hindu, as was also the profuse ornamentation of the texts from the Koran. Any minute description of the Baroda College was the less necessary as the working drawings exhibited spoke for themselves. The materials were red brick, a beautiful satin-grey sandstone, and glazed terra-cotta in red and green. What would doubtless interest them from a practical point of view was the dome-arch. With a view to a description of the principal dome, it was premised that the central hall is a square of 60 feet, recessed at one side for a senators' platform, and on the remaining three sides for a gallery projecting on brackets 7 feet into the room. Thus the whole area of the room was, roughly speaking, about 80 feet square. This form was adopted for acoustic reasons. Mr. Fergusson, in his

"History of Architecture," had pointed out the method adopted by the Beejapur builders for counteracting the thrust of a cupola by hanging weight on the inside. This principle had been carried out in the Baroda College. The manner in which this was done and the dome built up was demonstrated by means of a diagram. In this case it was proposed to leave the great eye permanently open, and to throw a light decorated cloth across it in such a way as to destroy excessive resonance and afford glimpses of the true dome from below. The recess at the north side measured 26 feet, and the distance between the central ribs 25 feet. The differences and supports for the ribs being corbelled out added materially to the lightness of the appearance. The true dome, the author said, was original so far as he knew. The external diameter was 70 feet. The drum rested on a ring of carefully-dressed sandstone, cramped at the joints with gun-metal. The inner dome took a curvature securing the greatest strength; the outer one resting on this, as it were, by sixteen intervening ribs, all the thicknesses were but 15 inches. There were thus sixteen chambers; and by opening the lower end to the outside and the upper end to the inside a very perfect system of ventilation was secured. No centre was used during the construction, save to the angles of the false dome. The true cupola was turned ring after ring in brick on a very rough scaffolding. A photograph hanging on the wall showed the scaffolding still in position. The dome from the roof contained 1,400 cubic yards of brickwork, including the four-angle domes, covering the square and costing in Baroda, exclusive of finial and the ornate covering, about 800*l*. The total weight of the dome was about 1,900 tons. The pressure at the base was under three tons, and the width of the ring at the base 2 feet 3 inches. All the domes were constructed in the same way; the smaller ones, covering a square of 16 feet, were only half brickwork. The exterior of all would be covered with glazed tiles. At present, owing to the length of time likely to elapse before the necessary quantity could be turned out, the domes were ornamented with coloured sgraffito in cement. In conclusion, the author said that although he advocated an earnest and honest study of native Indian art, and its liberal use on palatial and monumental buildings, yet he would seize that opportunity of publicly deprecating as emphatically as possible any vulgar endeavour to squander ornament on new buildings of utility. Let as much thought be bestowed on the design as possible, as much labour on the execution as time would allow. But any attempts to redeem ugliness by useless additions to break a sky line, or by heaping up mere ornament, were nothing better than vulgar ostentation and a waste of public money. India, like other portions of the British Empire, had already suffered a good deal in this way, and was likely to suffer more. Good architecture would naturally follow in the wake of honest building, but it was scarcely to be thought that the converse would hold good.

Professor T. ROGER SMITH said he had great pleasure in moving a vote of thanks to Mr. Chisholm for the interesting paper with which he had favoured them. It was not easy, Mr. Smith said, on the spur of the moment to bring forward any remarks which might prove of value, but he had noticed that Mr. Chisholm had in his paper raised a point which was always a difficult one when it came to be considered, namely, the style that should be adopted for works to be executed in a foreign country. He believed that Mr. Chisholm had in practice chosen the most difficult part, and if he had succeeded, it was all the more honour to him. Only an architect who was thoroughly conversant with the indigenous styles, could have ventured on this as Mr. Chisholm had. The majority of architects contented themselves with working in a style they themselves were familiar with, even in a foreign country, or in a country in foreign occupation, as India was; and there was a good deal to be said in respect of European building for European purposes. If an architect was able to make himself master of native style, ornament, &c., by actual study of native works on the spot, he would doubtless acquire the power of designing works in harmony with the native works, the country and climate. Anyone who had had experience of designing such work would agree that it was impossible to succeed in it unless a man were prepared to spend his life on the spot, for it must be the work of a lifetime spent in a foreign clime. Mr. Chisholm had shown that he had mastered to a large extent the difficulties of domical construction, and he deserved congratulation for the success he had obtained in working out the native styles.

Mr. F. C. PENROSE seconded the vote, and remarked that Mr. Chisholm had shown great power in adapting the principles of Indian architecture to his work.

Mr. PANSON having said he understood from Mr. Chisholm that in the construction of the dome, which was of considerable size, no centres were used, asked a question as to the distribution of the weight, and how the ribs were supported; whether the ribs shown were semicircular?

Mr. CHISHOLM said that no centres had been used in the construction, except for the angles of the outer dome, and that the weight, which was 1,900 tons, gave a weight of 3 tons per superficial foot on the lower ring of the dome.

Mr. ARTHUR CATES said it was unfortunate they had not been able to have from Mr. Chisholm a more detailed account of the

construction of the building. He hoped that the "Transactions" would be supplemented with this technical description, as well as illustrations of the work. Mr. Chisholm, working as a European architect out in India, had done work there which as architects they all might be proud of. In reference to constructing a dome without centres, the cupola of the Duomo at Florence had been so constructed.

Mr. JOHN SLATER said he had recently had to superintend the building of a brewery kiln in London. It was executed by German workmen. The whole of it was vaulted without centres. He did not think English workmen could have done it at all.

Professor KERR said it should be clearly understood that domes required no centres at all. A dome and an arch were two different things. In the case of a dome there was no thrust at all; and if a dome were constructed as had been described that night, each ring, if really a ring, was its own tie, and there was nothing but dead weight upon the supports.

The PRESIDENT then put the vote to the meeting, observing that, as it was only a matter nowadays of a return ticket to India, he hoped they might hear more from Mr. Chisholm on a future occasion. The President, after saying it was the last meeting of the session, concluded by thanking the members for their numerous attendances, especially that night.

The proceedings then terminated.

EARLY RENAISSANCE ARCHITECTURE IN ITALY.*

BY R. ROWAND ANDERSON, A.R.S.A.

THE short paper I have to read to you this evening is on the Early Renaissance Architecture of Italy. The subject is too extensive to be undertaken in one evening. I intend, therefore, to confine myself chiefly to an explanation of its origin rather than to go into the architectural details of the buildings erected under the influence of this revival. The term Renaissance, or new birth, when applied to the great transformation that took place in the early part of the fifteenth century, embraces every movement now at work in the civilised world. It is of equal interest to the theologian, the jurist, the politician, and the man of science, as to the architect or painter. In its largest sense the Renaissance is the emancipation of the reason and the awakening of man to his right, to intellectual freedom, and to his consciousness of individuality. The force which was then put in motion is still at work in theology, science, and jurisprudence; its progress is steadily onward, while in architecture its steps are uncertain and wavering, and it is difficult to tell whither things are tending. It is this art phase of the Renaissance, in view of what is now taking place in architecture, that has the chief interest for us, and to which I wish to direct your attention. Up to the period of the Renaissance, which may be roughly held to have commenced about 1420, all arts were subject to the law of evolution or development from the rude gratification of the wants of man, and the results arrived at were not due to the personal work of individual artists, but of the whole tendencies and aspirations of the races which produced them, working through centuries of time. In Italy, at the period mentioned, the stream of art was checked and diverted, while outside of Italy Mediæval art continued for long afterwards to be the only art known and used. In France, at this time, the Flamboyant style prevailed, and the Perpendicular in England. They were then building the west front of Gloucester Cathedral, and the chapter-house at Exeter, and the cloisters at Norwich; for long afterwards one could not predict the coming change. In order to understand why art was thus diverted, and why the change commenced in Italy, it will be necessary to make a few observations on the two causes that led to this. The first was the state of architecture in Italy, and the second the revival in that country of the learning of Greece and Rome. Italy was never peopled by a homogeneous race. The Greeks occupied all the southern part of the country, and established flourishing commercial cities on the sea-board; the Ligurians the country about Genoa; the Phœnicians established themselves and their arts in Etruria; while the Trojan fixed himself in Latium, the heart of the country. To that latter people was given the destiny to unite all the strength of Italy in one power, that of Rome, but without extinguishing their nationality or customs. On the break-up of that empire in the fifth century, Italy again fell to fragments. The effete empire was seized by the Herulians, to be succeeded by the Ostrogoths under Theodoric, who in turn were overthrown by the Lombards. These ruled all the north with the exception of Venice, and as far south as Beneventum, till they were overthrown by the Franks under Charlemagne, while further south the Saracens and Normans conquered and held possession of Sicily and Calabria, and although each of these peoples failed in absorbing or moulding the native races into a united kingdom, they each created and left strong architectural evidences of their presence. Hence it is that in the mediæval architecture of

* A paper read at a meeting of the Edinburgh Architectural Association.

the Italian peninsula you behold a mirror of its political history, wherein may be seen the struggles of the Greek, the Byzantine, the Lombard, the Norman, the Saracen, and the Frank for the mastery, but not a consistent style of architecture as was produced in Britain, France, or the Teutonic nations. For convenience, classing all the different styles of architecture that prevailed up to the era of the Renaissance as Italian Gothic, you find in it a constant tendency to recur to Classic details and principles. The magic spell of Rome never died. A pure Gothic building, as we understand it, is unknown in Italy from the Alps to the Gulf of Taranto, and the only buildings with traces of northern art in them, such as Milan Cathedral, San Francesco at Assisi, and the church at Vercello, were built by French or Germans. As you all know, the higher parts of a northern Gothic structure, whether civil or ecclesiastical, are always the logical outcome of the parts immediately below, and the whole structure is articulated and decorated in a consistent manner, while in southern Gothic there is not that consistency or logical construction and articulation of parts; everything is considerably jumbled.

In the churches the gables are mere screens; they have frequently no reference whatever to the structure, or, if they have, they embrace in one span nave and aisles. In their great churches the parts are few, and all on a large scale, as at Florence and Bologna, in place of that smallness and multiplicity of parts common to all northern work. You find an almost constant use of the pier characteristic of pure Roman art, or the single column used by the Romans under the influence of the Greeks. The square abacus and classic section of base mould prevailed to the last. The arches are always very square in section, and have few mouldings; marble veneering, as in the old Roman structures, was largely indulged in.

In windows the mullion is almost unknown, and its place is taken by a column with base and capital. There is a constant use of the round arch. The scientific and beautiful varieties of vaulting in northern structures are not met with; but, above all, the buttress was ignored. At the most it was expressed by a pilaster, and their arches and vaults are everywhere tied with iron rods.

You will thus see that the Mediæval architecture of Italy, when the second cause is noticed and understood, yielded an easy victory to the Renaissance. The geographical position of Italy, its intercourse with the east, and more particularly its sub-division into numerous republican centres, and the kingdoms of Sicily and the Papal States, each competing with its neighbour and the Pope trying to enslave them, but all jealous of their rights and privileges, created an atmosphere of strife and self-reliance, and developed strong individual character. Their contact with Mahomedanism, which up to this time was the depository of ancient Greek learning, and their commercial intercourse with all the then known world, gave the Italians a very cosmopolitan character, and evolved that spirit of intelligence and impatience of dogmatic control which constituted the motive force of the Renaissance. All through the Middle Ages faint memories of Greece and Rome existed, and the desires of humanity outside the Church were embodied in a tale that arose in the sixth century during the struggles between Christianity and the profession of magic. It became popularised in the thirteenth century as the Golden Legend, and is now known as the story of Dr. Faustus. This legend tells of what the fore-runners of the revival longed for, namely, the secret of human enjoyment, and the source of the strength of the ancients, but which could only be recovered by selling the soul to the Devil. It embodies the aspirations and yearnings of the Middle Ages, and its anxious curiosity regarding all thoughts and things which was so sorely fettered by the dogmatism of the Church; and that which could only be yielded up for such an awful price was gained for humanity by the genius of the Italians of the fifteenth century. Probably the man who gave the greatest primary impulse to the revival of learning was the Emperor Frederick II., who was crowned by the German Ghibellines at Aix-la-Chapelle in 1212, King of the Romans and Germans.

After sundry disputes with Pope Honorius III. he received from him the crown of empire. He then devoted himself to establishing order in his kingdom. The Italian language rose above a patois at his court. He encouraged poets, was himself a maker of verses and a great linguist. He encouraged learning by establishing schools and universities; but, above all, he was a man of great independence of thought, and is accused of having written a book against the Revelations of Moses, Christ, and Mahomet; he had no belief in the sanctity of Popes, and spent the greater part of his life and power in combating their enterprises, although at its close, when worn out mentally and physically, and embittered by the treason of men he believed to be his friends, he sought the favour of the Church, but died in 1250 before the reconciliation took place. The writings of Averroes, an Arabian freethinker, made their appearance in Italy about this time. He was the Bradlaugh of the period, and appears to have given as much trouble to the Church as Bradlaugh has given to Parliament. The next great names in the Italian Renaissance are those of Francesco Petrarca, born in 1313, and Giovanni Boccaccio, both Florentines, the first best known by his sonnets in praise of Laura, and the second by his collection of novels, in which he describes with rollicking frankness the manners of his time. But

these were only their lighter labours. Petrarch had an all-absorbing passion for ancient learning and art. As a boy he was accustomed to read the prose of Cicero, and, when grown up, he devoted himself with enthusiasm to collecting manuscripts of his favourite author, frequently making long journeys to places where it was reported fragments were to be found. He was the first to suggest the formation of public libraries.

He accumulated coins and inscriptions, and advocated the preservation of ancient buildings. He lived in constant strife with the scholastic theologians, the physicians and astrologers, and all who by their falseness and narrowness obstructed the healthy and free action of the thoughts of man. At this time the ruins of ancient Rome still remaining were numerous, many of them being used as fortified residences by the nobles. Some idea of their number may be formed from the fact that, in 1258, one hundred and forty of these were destroyed by the Senator of Rome for public reasons, and many others were used as quarries. Petrarch's visit to Rome at this period appears to have been as delightful to him as a sketching tour would be to any of us. He tells of the pleasure he derived from wandering among the ruins with his friend Giovanni Colonna, and of their discussions on ancient Roman grandeur. Petrarch died in 1374, but not before he had kindled a flame that has never yet been extinguished. His friendship for and influence over Giovanni Boccaccio led the latter to take up the pursuit of ancient learning. He had tried commerce and law in his youth, but the influence of Petrarch determined his choice, and, with the consent of his parents, he devoted himself to study. Being a man of most indefatigable energy, he did much to advance the cause of learning, the collecting of ancient manuscripts, and was one of the leading spirits who prepared his country for the great humanistic movement now rolling onward with increased momentum. He died in 1375.

The next name I would call to your notice is Poggio Bracciolini, a man of rare parts, and like all the men of this period possessed with a great appetite for work. When holding the post of apostolic secretary, he attended the Council of Constance in Switzerland in 1414, and having plenty of leisure time, he devoted it to the exploration of Swiss and Swabian convents, and succeeded in rescuing many masterpieces of Roman literature. To him we are indebted for unearthing the manuscripts of Vitruvius Pollio, a Roman architect of the first century of our era, and whose writings on architecture form the basis for all similar treatises. Bracciolini was the first to make a critical inquiry into the topography of Rome, comparing the then existing remains with the allusions to them in ancient authors, and a favourite amusement of his was acting as cicerone to strangers visiting the city and watching the effect the magnificent ruins produced upon them. By this time a passion for collecting and studying everything relating to ancient Greece and Rome became the one absorbing occupation of educated Italians, and the time had now arrived when it was to yield some fruit in architecture. The bias towards Roman forms, which I have shown you always existed in the architecture of Mediæval Italy, was now quickened and determined by the widespread revival of learning. There was no association in those days for the preservation of ancient monuments, no such sums were lavished on the restoration and conservation of the buildings then in use such as we have seen in England in our days; everything was sacrificed to this desire to revive Classic art. Florence was now the intellectual capital and the source of culture and humanity for all the rest of Italy, and it so happened that the leaders of the two political parties in that commonwealth were also leaders of intellectual progress. These two men were Cosmo de Medici and Rinaldo degli Albizzi. The struggle for power ended in the defeat and banishment of the Albizzi. Cosmo de Medici's desire to found a family and to trample out all greatness but his own, probably gave the first great impulse to building in the new style. He had a great love for buildings and all the arts; this, combined with his enormous wealth, enabled him to employ artists and workmen of all kinds, and so collect about him a large body of dependants whose interests were identified with those of his family. Two architects, of great renown lived in Florence at this time, and were largely employed by the Medici family—Filippo Brunnelleschi, and Michelozzi. Brunnelleschi was a sculptor as well as an architect, having entered into competition with Lorenzo Ghiberti and others for the gates of the Baptistery of the Cathedral of Florence, and not being successful he gave up sculpture and resolved to stick to architecture. He went to Rome with Donatello, the sculptor, as his companion, and spent several years there in measuring, drawing, and studying the remains of Roman architecture, or, as Vasari in his life puts it: "His every thought was of architecture which was then extinct; I mean the good old manner, not the Gothic and barbarous one which was much practised at that period." On his return to Florence in 1407 he found employment on many buildings, and after returning from a second visit to Rome, he was employed to complete the cathedral of Florence, his share of that great work being the dome. For the Medici family he worked at the churches of San Lorenzo, the Santo Spirito, and the abbey of Fiesole. For the Pitti family he designed and commenced the great palace of that name. Michelozzo Michelozzi, like the former, worked also as a sculptor under Donatello. For Cosmo Medici he erected the

great palace now known as the Riccardi, and carried out extensive works at the Palazzo Vecchio, a palace at Mugello, and the convent of the Zoccolanti, and many other buildings. Another great Florentine, Leone Battista Alberti, a man of good family and fortune, an accomplished scholar and artist, did much to advance the knowledge and practice of architecture in the new style. In Florence he designed the beautiful Rucellai Palace. His church of St. Andrew at Mantua is much admired, as also his work at Rimini for the Malatesta family. A very important but less known name is that of Luciano Lauranna, the architect of the ducal palaces at Urbino and Gubbio, and whose works illustrate that freedom of treatment so characteristic of the revival. One of the grandest city residences built at this time is the Palazzo Strozzi, by the architect Benedetto de Majano. It is looked upon by many as the finished type of Florentine work.

A very curious work is supposed to have had much influence on architecture at this time. It was written by a Venetian monk of the name of Giovanni Colonna in 1467, and afterwards issued from the Aldine Press in Venice in 1499. It is known as the "Hypnerotomachia Polyphiri," or the "Dream of Polia." It is extremely scarce; an imperfect copy of it may be seen in the Art Library at South Kensington. The drawings illustrating the book are in the best style of the period, and, although it was written before the works of Vitruvius appeared, the author must have had an intimate acquaintance with the numerous remains of Roman art that then covered Italy. Under the guise of a love story, he inculcated the soundest canons of architecture, and maintained that golden rule which the writings of Vitruvius and the increasing pedantry of the scholastic movement destroyed, that a building must not only be solid and well proportioned, but that it must be impressed with the character of the purpose for which it was erected, and that all ornament must arise out of the construction and utility of the building. The last of the great architects of the early Renaissance was Bramante Lazzari, born in 1444. His early professional life was spent in Lombardy, chiefly in the service of Ludovico Sforza. The beautiful octagon sacristy of San Satiro and the grand cloister of the convent of Saint Ambrogio, in Milan, are by him. The domed church of the Incoronata built in 1476 at Lodi, and a somewhat similar, and, in my opinion, finer church—the Consolazione at Lodi—illustrate the practice of this great master. On the fall of his patron, Sforza, he betook himself to Rome about the year 1500, and was much employed there. His share in the erection of St. Peter's is entirely obliterated, but the great palace of the Cancelleria and the Giraud palace near St. Peter's, and the Belvedere at the Vatican display, notwithstanding a certain feebleness, his correct taste and fine sense of proportion.

Although these are the leading names of the architects, and their works of this period, in all the other towns, great and small, there are still to be found examples of the architecture of this period. Venice has many palaces quite as important as the Florentine ones. In Verona, Padua, Ferrara, Lucca, Pistoja, and Bologna the works of less known or unknown men, but equal in merit to the others, attest the great change that had now taken place, and its great characteristic and merit is that it was an age of experiment or transition combined with great inventiveness. The architects were not yet cramped by academical formula, and there was a freedom in their treatment both of plan and elevation that was henceforth gradually to disappear. The great defect of the new art is its want of structural sincerity, inasmuch as the vaulting and arching is still as in the Mediæval period, tied with iron rods. Scholarship was drifting in the same direction, rule and precedent were now becoming supreme. Printing had been invented, and the press of Aldus Manntius in Venice sent forth the work of Vitruvius, which became the text-book of the day. Literature and art were now judged by a pedantic purism. Cardinal Bembo advised Sadoletto to study the writings of Cicero rather than those of St. Paul, so as to preserve correctness of style. The Renaissance movement was now becoming cramped; freedom and invention in the treatment of buildings rapidly gave way under the limitations of Roman art as interpreted by the scholars of the day, until it expired under the barocco of the seventeenth century.

THE ASHBURNHAM MANUSCRIPTS.

IT is much to be regretted, says the *Times*, that the negotiations between the Trustees of the British Museum and the Government for the purchase of the Stowe and Appendix sections of the Ashburnham manuscripts have not been brought to a satisfactory conclusion. When the Government refused to entertain the idea of purchasing the entire Ashburnham collection, including the Libri and Barrois manuscripts, it expressed its willingness to listen to proposals for the acquisition of a portion of the library, and, acting on this suggestion, the Trustees, after obtaining Lord Ashburnham's consent to divide the collection (which he had originally refused to do), recommended to the Government the purchase of the Stowe and Appendix sections alone. It will be remembered that the Stowe manuscripts are a thoroughly English collection—Anglo-Saxon charters, State papers, monastic chartularies, &c.—and also

include a valuable set of Irish manuscripts; and that the Appendix, besides English manuscripts of Wycliffe, Chaucer, and others, contains illuminated manuscripts of the greatest beauty and of a class which rarely comes into the market. The Trustees then recommended the purchase of this portion of the library for 90,000*l.*, the price which, after some negotiations with Lord Ashburnham, was finally decided on. These terms, however, the Government declined, but offered the sum of 70,000*l.* In his turn, Lord Ashburnham refused this proposal, and adhered to the former valuation. In the face of this difficulty the Trustees would have been justified in declining to take further trouble in the matter, but they had satisfied themselves of the national importance of the collection, and refused to abandon negotiations until every effort had been exhausted. In the hope, therefore, of smoothing the difficulties of the Government, and not without reason for believing that the step which they were about to take was agreeable to influential members of the Cabinet, they made a final proposal to make up the 20,000*l.* difference between Lord Ashburnham's price and the Treasury valuation by reductions in the British Museum estimates during the next five years. This proposal, however, has not found favour in the eyes of the Government. At their meeting on Saturday the Trustees received a communication from the Treasury that Her Majesty's Government declined to give more than 70,000*l.* for the Stowe and Appendix sections of the Ashburnham collection.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE concluding meeting of the society for the present session was held in Edinburgh on Monday, Dr. Arthur Mitchell, vice-president, in the chair. In the first paper Dr. R. Angus Smith, Manchester, discussed the question—"Who are the Celts?" Oneness of language, he remarked, was no proof of oneness of race. Ireland was a great example of the separate existence to the present time of various races. The nations now called Celtic, and those also which were called Celtic, had little similarity, and in some cases were remarkably diverse—as unlike each other as any one race was different from another. Taking the people of Gaul and of Celtic Britain and Ireland, he found that they did not answer the description of any theory of the Celts whatever. The Welsh and Irish were remarkably different in height, in weight, in expression of countenance, as well as in character. He regarded the races at present called Celtic as more mixed than less Western races, and as containing types from the earliest times. The Celtic nations were made up of various peoples—mixtures of men who came to Europe before them as well as after them, and their languages were in part remnants of the pre-Celtic tongues, which were overpowered by the true Celtic. The second paper, by Mr. John M. Macnab, was an examination of the origin and significance of the symbol of the twentieth legion of the Roman army in Britain. This symbol, as is well known, was a running boar, and Mr. Macnab, after alluding to the instances in which that symbol was attributed to the legion itself and to the vexillation of the legion to which it was first applied, went on to state that he regarded it as having reference to the Caledonians in flight before the victorious Romans, and supported this view by reference to the sculptured stones of Scotland. In the third paper Mr. Angus J. Beaton gave descriptions and measurements of some ancient fortifications in the north-western district of the Black Isle, Ross-shire, including a fort near the Muir of Ord; David's Fort in Conanwood, and near it another construction of circular form surrounded by a ditch which though it has been called a fort is more likely to have been a place of sepulture; and a fort at Loch Lundie, near the Ord Hill of Kessock. He also noticed some remains of stone circles in the same district. The paper was illustrated by carefully prepared plans and sections. In the fourth paper, Rev. J. Menzies, minister of Fordoun, gave a notice of some cup-marked stones which he had discovered built into the walls of the chapel of St. Palladius there. Mr. Alex. Hutchison, architect, Dundee, followed with an interesting account of the discovery of earthenware jars built into the walls of a dwelling-house adjacent to "Whitehall Palace," Dundee. He explained that when some of the buildings were being removed recently so as to form the new street from the Nethergate to Dock Street, several jars were found built into some of the old walls, with their apertures exposed to the outside. Many of them had been destroyed before attention had been directed towards them; but several nearly perfect examples had been preserved. Through the courtesy of Mr. Mackison, F.S.A. Scot., Burgh Surveyor of Dundee, he was able to exhibit these to the meeting, and through the kindness of Mr. A. C. Lamb, F.S.A. Scot., he was in a position to submit photographs of the buildings, showing the positions which the jars had occupied. In tracing the history of the use of such jars in architecture, he showed that they were occasionally inserted into spires and domes of churches and other buildings in foreign countries, either to attract birds towards these erections or to improve the acoustics. So far as he could find, no previous instance has been noticed of the use of such ware in the domestic architecture of Scotland. It is not impossible that these jars may indicate the survival of a forgotten

superstition which has not yet been thoroughly explored. The paper was listened to with close attention, and the thanks of the meeting were accorded to Mr. Hutchison for his communication.

Dr. Robert Munro, of Kilmarnock, gave an account of the discovery of a hoard of five flat bronze axe-heads and a bronze ring at the Maidens, near Culzean Castle, Ayrshire, in the course of operations for the construction of a shipbuilding yard on the property of the Marquis of Ailsa. They were found at a depth of four feet, of which the lower two feet was shingle, and the other two feet a talus of vegetable soil. The distance from the shore was 100 yards, and the height above the present sea level 25 feet. The axe-heads were all of different sizes, the largest about 5½ inches in length. They belonged to the earliest type of axes used after the introduction of metal. Such finds of bronze tools were rare in Scotland, and are of such importance in a scientific point of view that it is to be hoped that the Marquis of Ailsa will ultimately deposit them in the Scottish National Museum. The other papers were a notice of the discovery of additional cup-marked stones near Killin by Mr. D. Haggart, communicated by Mr. J. Romilly Allen, F.S.A. Scot.; a notice by Mr. Romilly Allen of two wooden locks from China similar to the old wooden locks in use in the remoter districts of Scotland; a notice of a collection of beads and spindle-whorls of stone, &c., from the north-west provinces of India, by Mr. J. H. Rivett Carnac, illustrated by a small collection sent to the museum by Mr. Rivett Carnac; and a notice of some of the urns in the museum that have been found associated with articles of use or ornament, by Dr. Joseph Anderson. Mr. Archibald Stavert of Hoscote exhibited a finely-polished stone axe of Avanturine quartz, recently ploughed up on his property near Jedburgh; and Dr. Blair exhibited an urn with peculiar ornamentation found at Tent's Muir, near Cupar. Mr. James B. Kerr, banker, Kelso, also exhibited and presented an interesting holograph of Sir Walter Scott, through Professor Duns.

LICHFIELD CATHEDRAL.

AN appeal is now being made for funds to complete the restoration of the west front of Lichfield Cathedral. Dean Bickersteth states that when he was appointed to the deanery in 1875, his attention was soon fixed on the exterior of the building, and especially on the west front, which about sixty-three years ago had been patched up with Roman cement, the few weather-worn figures which still remained at the time in their niches having been daubed over with the same material. In the process of that work of vandalism, much of what remained of the delicate sculpture and beautiful mouldings of the thirteenth and fourteenth centuries had been chipped away; and the restoration of the grand façade according to its original design would have been almost hopeless, had it not been that some of the details of this sculpture had escaped the pikes of Cromwell's soldiers and the Roman cement. With the help of these details, recovered for them by skilful masons and sculptors, under the prudence of the late Sir Gilbert Scott, assisted by an able and conscientious clerk of the works and an excellent body of artisans, they had been enabled, through God's goodness, to bring that great undertaking very nearly to its completion. It was now some six years since the work was begun, during which time they had expended upon it some 30,000*l.*, about half of which, including a noble gift of 4,000*l.* from Mr. Heywood Lonsdale, had been raised by subscription. They wanted about 2,000*l.* more.

THE GLASGOW INSTITUTE OF ARCHITECTS.

THE following letter has been sent by the Secretary of the Glasgow Institute to each member of Parliament for Scotland in reference to the Burgh Police and Health (Scotland) Bill:—

81 Bath Street, Glasgow, June 11, 1883.

Sir,—As instructed by the council of this Institute, I beg to enclose copy of a communication addressed by the Institute to the Lord-Advocate in reference to the Burgh Police and Health (Scotland) Bill now before Parliament, and most respectfully direct your attention to the very important point specially referred to therein.

The only object which the Institute has in view in actively interfering in this matter is to aid in securing for the country a proper Building Act, and for this they believe the complete separation of police and building regulations to be essential.

The threatened opposition to the present Bill, on the ground that it "interferes compulsorily with the existing system of police and municipal administration, and repeals several local Acts obtained by burghs, after due Parliamentary inquiry, for the better government and improvement thereof," seems itself to prove the expediency of the course which from the first the Institute has recommended; for while it is quite possible that there may be good reason for some diversity in the police regulations of burghs, there can be no justification for diverse building and sanitary regulations, and there is no necessary connection between police

administration and the administration of laws relating to buildings. The independence of burghs in other matters should not free them from the obligations of identical building laws.

The council of the Institute do not think it necessary at the present stage to criticise the clauses of the present measure in detail; but I am desired to say that in their opinion they are exceedingly defective and unsatisfactory.—I have the honour to be, &c.

Copies of the enclosures were published in *The Architect* on April 28, 1883.

NORTHERN ARCHITECTURAL ASSOCIATION.

A QUARTERLY meeting of members of the Northern Architectural Association was held on Tuesday in the Old Castle, Mr. S. Oswald presiding.

The secretary (Mr. W. H. Dunn) read a letter from Mr. A. Darbyshire, enclosing a prospectus of the forthcoming Building Trades' Exhibition, and drawing attention to the proposed collection of architectural drawings in connection therewith. It had occurred to the committee that a representative exhibition of architectural drawings would be extremely interesting, both to the profession and to the public generally. It would form a main feature of attraction in connection with the Building Trades' Exhibition. Ample galleries were placed at the disposal of the committee, and no charge would be made for space in the gallery of architectural drawings. The committee would be pleased to receive competition drawings, representing proposed works and works actually executed; ornamental designs, designs for all kinds of decorative work; and also constructive designs showing the application of any particular material. The committee hoped they would assist the object in view by sending a selection of their works; and, in order that an idea of the space required might be obtained, he would ask them to fill in the form attached to the prospectus, measuring over frames or sketches, and return the same.

Mr. William Glover read a paper on "The Influence of Natural Forms on Architecture." He said that architecture or the art of building was one of the most ancient of arts. Whether man came from the hands of his Creator a matured and perfect being, or, as Darwin would have it, his development had been by successive stages through untold ages, it was evident that when he arrived at his present stage his first thoughts would be directed to protection and security, and his highest instincts would lead him to feel that there was a Being or influence greater than himself who called for love and adoration. Thus he would be led to feel a desire to erect buildings for the protection of himself, and for the worship of the Being or influence he loved or feared; and as the mind of man could not imagine anything but that which exists, his imagination must be formed on existing things. This would lead him to look to Nature, and see her wondrous works, which had been developing or decaying through countless ages. He would see her rock walls, overhanging cliffs, washed caverns, and tree trunks—in the rock and cavern see her resistance to thrust and pressure; in her overhanging cliffs the principle of counterpoise; in her round and diminishing trunks the resistance to thrust. He would then have discovered the great principles of construction. In decorating his structure he would again look to Nature. The reed bending or breaking would give him the graceful curve or intersecting line. The beautiful form of the feather, the foliage of the palm, the relief in the cone, and the bursting seed pod, the grace of the honeysuckle and the acanthus, the deep shadows of the egg, and in many other forms Nature would speak to him, and thus she would not only have her influence, but would be the parent of the art. The early works of the Egyptians, Assyrians, Greeks, Romans, or our modern Gothic were the most pure and graceful from their close imitation to Nature. The Greeks, perhaps, might be called the great masters of this art. Through all her stages, even in her most luxurious age, she never spoiled her form with ornament. The grace and beauty of her sculpture, the orders of her architecture, the sublimity of her literature, the simplicity of her laws were subjects of imitation with all civilised nations, and this, owing to her love of study of Nature, the great author of all art. There was little doubt in his mind that the rapid development of the Early English Gothic was owing to its striking Nature's keynote in the simplicity of its structure and decoration which influenced us in devotion. He knew of no style so well adapted for worship as the Early English Gothic. Nature had not only been the parent of our constructive and decorative art, but had fixed the sites for our ancient cities and highways. She pointed out a commanding site for a fortress, &c. The more we studied Nature the more we saw her influence. Her great principles must stand for all ages. The way we clothed them was only the fashion of the hour. There was one of Nature's laws we were very careless about, and the neglect of which was causing the destruction of our stone buildings. Nature formed the stones in beds; we reversed this, and made the bed the exposed face. The weather acting upon this affected the face, and caused its beds to shell off. Nature spoke very loudly to us in the appearance of our buildings, and he trusted we would listen to her. There was a bright future in store.

Our nation was having a higher art education. Rapid strides had been made during the last twenty-five years. Our street architecture was more varied in design, with honest construction and decorative tone.

The Chairman moved a vote of thanks to Mr. Glover for his excellent paper.

Mr. J. Morton, South Shields, seconded the motion, which was supported by the secretary, and carried.

The meeting shortly afterwards terminated.

SOCIETY FOR THE ENCOURAGEMENT OF FINE ARTS.

ON Saturday last the Council of this Society invited Mr. J. Edmeston, who has for seven years acted as chairman, to a complimentary dinner at the Café Royal. Sir J. W. Ellis, Bart., V.P., occupied the chair, and was supported by Messrs. Phil. R. Morris, A.R.A., Storey, A.R.A., C. B. Birch, A.R.A., Major Mercier, Drs. Phené, F.S.A., E. P. Brock, F.S.A., Linton, V.P. Inst. P.W.C., Orrocks, Cope, West, Belt, Lennox Browne, Dicksee, Allen, Sir C. F. Shand, and Messrs. Gilbert, A. Cotes, G. Truefitt, Cave Thomas, vice-chairman, and others. The chairman proposed Mr. Edmeston's health in flattering terms, alluding especially to the services which had been rendered by the latter acting as Lord Mayor's deputy during his recent year of office. Mr. Edmeston acknowledged in feeling terms the great and unexpected compliment paid to him, expressing his belief that the demonstration was really an expression of approval and interest in their Society and of confidence in its future. A most enjoyable evening was spent by all.

BRISTOL AND CLIFTON JUNIOR ARCHITECTS' SOCIETY.

ON Tuesday evening a general meeting of the members of the Bristol and Clifton Junior Architects' Society was held at the Bristol School of Art, the vice-president (Mr. J. C. Moncrieff, A.R.I.B.A.), occupying the chair. In his opening remarks the chairman stated that some time since he had the pleasure of presiding at a meeting at which it was proposed to reorganise the society. Considerable delay had, however, occurred through the society wishing to re-establish themselves as an architectural society in connection with the Academy, and possess the rights of the original society. It had been found necessary to hold several interviews with the President of the Academy on the subject, and he had expressed a wish to re-establish the society with its sister art under the old regulations. The honorary secretary, Mr. W. E. Hill, stated that the president had very kindly consented to act again as president for the ensuing year. The chairman proposed, and Mr. Cridland seconded, the adoption of the following programme of visits for the sketching season, and the same was carried: Saturday, June 30, Bitton; July 14, Temple (Bristol); Saturday, July 28, Bath; Saturday, August 11, St. Peter's and the Mint; Saturday, August 25, Backwell Church, Nailsea Church, Wraxall Church, Cadbury Camp, and Portbury Camp; Saturday, September 8, Redland Green Chapel; Saturday, September 22, St. James's Church. It was mentioned to the president that Mr. Charles F. Hansom, F.R.I.B.A., had kindly consented to distribute the prizes won in the annual competition, and that the prize works would be exhibited on the occasion. Mr. Hill proposed, and Mr. Edwards seconded, a vote of thanks to the chairman, who responded.

Timber Stages and the Building Act.—Mr. Cobbett's Timber Stage, Drummond Street.

SIR,—As I saw no reporters present when this matter was before the magistrate at the Marylebone Police Court on the 23rd ult., I am perhaps right in assuming that the report contained in *The Architect* of the 2nd inst. was communicated. I need only disclaim generally some nonsensical evidence attributed to me; but as an accurate statement of the essential facts of these cases is always desirable, I venture to ask you kindly to insert the following:—

The stage as erected covers a space of ground about 22 feet by 28 feet, and is about 17 feet 6 inches high. It consists of nine upright posts in three rows of three each. Stout girders in both directions unite the posts at the top. The posts and girders are about 13 inches square, all mortised and tenoned, and further secured by dog-irons, and the structure is stiffened by substantial braces and cross-braces. The posts are tenoned to stone bases mortised for them, and which rest on deep concrete foundations

under the ground level. Over the girders are set on edge, but not yet nailed, joists, 11 inches by 3 inches, about 12 inches apart. Prior to commencing the work, application was made to the Metropolitan Board to sanction a similar structure, but with the addition of boarding and metal work on the flat top; but the application was refused.

These are all the facts pertinent to the question, which I understand to be whether this is a "building" or not? Lawyers are accustomed to add "within the meaning of the Act." The Act, however, appears to me to have but one meaning, and that is the common sense grammatical meaning.

A "building," I take it, is anything built, or, as Mr. Justice Byles has said, "some structure or erection of considerable size, intended to be permanent, or at least to last for some time, whether let into the ground or not."

I accept this description, and I find in the Building Act the following "buildings" mentioned for the purpose of exempting them, viz., "bridges," "piers," "jetties," and "walls" of various kinds, as well as houses. There appears a general tendency to confound a "building" with a "house," and to say that a structure is not a building unless it has a roof; but I believe that both "building" and "house" are derived from the same Saxon, and while the former includes every "structure," the latter means a building with a roof. Thus we have "dwelling-house," "coach-house," "summer-house," "fowl-house," "out-house," "pent-house," &c. The Building Act declares all "buildings," of whatever kind, except those specially exempted, to be subject to it.

My own practice, equally with that of my predecessor (going back more than fifty years, and hitherto undisputed as far as I know), has been to treat the structures in question as "buildings." I am not able to understand upon what principle it has been decided that the one in question is not so; but I take it that it is a question of fact, as to which there is no appeal; nor, if it were otherwise, do I consider it my duty to carry a case to the superior Court. The decision, therefore, binds this particular case only, but it is of course embarrassing as regards future practice.

I have a case now where a saw-mill proprietor has erected in a most crowded locality a wooden annexe to his saw-mill, with a boarded flat over it, and on my remonstrance has (guided by this decision) simply removed the boarding. His machinery projects from his mill into the annexe, and he will no doubt pile deals on the top so as to keep out the weather, and thus defy the provisions for safety from fire which the Act was intended to insure, and, as I still think, when rightly interpreted, does insure.

If this decision be correct, what an anomaly we have in an Act so jealous of fire as to disallow in a walled building a scrap of wood nearer than four inches to the face of the walls, while a structure of the most inflammable kind, heaped with goods equally inflammable, and stacked for drying purposes in the most dangerous manner, may be erected close by, with chimneys all round delivering their smoke and heat, if not flame, right amongst the wood.

I am, Sir, your obedient servant,

FREDERICK WALLEN,

District Surveyor for West St. Pancras.

106 Gower Street: June 6, 1883.

LEGAL.

Worship Street Police Court.—June 12.

THE METROPOLITAN BUILDING ACT.

On Tuesday Her Majesty's Commissioners of Works were summoned by the Metropolitan Board of Works to show cause why they, being the owners of a structure in Victoria Park, should not be ordered to pay 1*l.* 2*s.* 3*d.*, the fees incurred by the surveying of the building by Alexander Payne, district surveyor. The Hon. A. Gathorne-Hardy appeared to oppose the claim for the Commissioners; Mr. Norman Bevan appeared for the Metropolitan Board of Works. The summons was taken under the Metropolitan Building Act, 1855, part 2, which gives power to district surveyors to survey any structure, and if found dangerous to give notice, and send in an account of fees. The Board of Works, Mr. Bevan explained, maintained that they had a right to interfere with any building within their area. The Hon. A. Gathorne-Hardy said this was a very important question, and had not been raised since 1866. The contention he should argue for the Commissioners of Works was that the buildings employed for Her Majesty's use and service were exempted in the second part of the Act, as in the first part. He agreed that there was no special exemption in part 2, but the words of the first part, section 2—viz., "The following buildings and works shall be exempt from the operation of the first part of the Act: Bridges, &c., Her Majesty's royal palaces, and any buildings in the possession of Her Majesty, her heirs and successors, or employed for Her Majesty's use or service"—implied a similar exemption throughout the whole Act. He maintained that, notwithstanding these exemptions were not specified in part 2, it did not do away with the general principle of law, that the Crown was not bound by any Act of Parliament unless it was specially provided accordingly. It was quite proper that the Metropolitan Board should have general power to supervise build-

ings in the metropolis, but the Crown had its special surveyors and officers, whose duty it was to inspect all Crown property and buildings, and see they were maintained in safety. Mr. Bevan challenged Mr. Gathorne-Hardy's assertion that the Crown property was exempt. It would not be competent for the public authorities to pass a dilapidated building which might be dangerous to passers-by, simply because it was Crown property. Evidence having been given by the district surveyor as to surveying and condemning the building (a lodge in Victoria Park), the magistrate adjourned his decision for a fortnight.

ARCHÆOLOGY.

Tesselated Pavement.—Mr. Storrie, curator of the Cardiff Museum, has successfully brought from Caerleon some portions of tesselated pavement found at Caerwent in 1881. Mr. Storrie intends to build it into the staircase wall at the Cardiff Museum. Mr. Octavius Morgan, president of the Monmouthshire and Caerleon Antiquarian Association, thus describes the pavement: In the spring of 1881, a portion of a tesselated pavement was discovered in the garden of a cottage at Caerwent, and we were in great hopes to be able to uncover the flooring of a large and perfect room. But unfortunately the pavement extended but a very little way beyond the portion at first discovered, a wall, the foundation of which remained, having at one time been built across it in one direction, and a pathway made in another. What remained of it was the corner of an apartment. Sufficient, however, existed to enable us to make out the entire design of the work. It seemed to have formed part of the flooring of a room about seventeen or eighteen feet square, with a portion of some other apartment adjoining. The design consisted of a square formed by a wide double-plaited fret, within which was a circle formed by a fret, consisting of a single plait, thus forming a spandrel at each corner, in one of which, the only one remaining, was depicted a large fish with all the characters of a salmon, as will be seen by the coloured drawing of it, which has been carefully made, and there can, I think, be no doubt that the other three spandrels were ornamented in a similar manner. Within the circle were eight hexagonal figures bordered by narrow frets, and within these was a central circular space bordered by a fret, but of the ornamentation of this space there were no remains. Each of the hexagonal figures, however, seems to have been ornamented with representations of two fish, but only two of these remain, and they are not perfect. The fish in one seems to have been a trout, judging from the tail, and a dark eel crawled up beside it, but the heads of both are, unfortunately, wanting. In the other hexagon it is not easy to decide what fish are intended to be represented, but I think it very probable that all the varieties of fish taken in the Severn and rivers and streams of the neighbourhood may have been represented, and as such decorations would be well suited to an eating apartment, it is probable that that chamber may have been the eating chamber.

Discoveries in Würzburg.—An interesting piece of almost pre-mediæval architecture was brought to light at Würzburg a few days ago. In the process of enlarging a shop the workmen came upon a considerable portion of an old cloister which had been partly built up into modern walls, and which presented, when cleared of all excrescences, many features of great beauty. Careful comparison satisfied the local architects that it was older than the church, still standing, built by Bishop Henry in the year 1000, and it must have been an appendage to the "new minster" of St. Saviour, built about 746, and destroyed by lightning in 854, in the course of a terrific storm which swept over all south-western Germany with such violence that people thought the end of the world was at hand. The proprietor of the place has handed the remains over to the architect of Würzburg Cathedral, Herr Friedreich, with instructions to clear the whole space around, so as to allow this monument of the earliest Middle Age to be studied by all lovers of art. Romanesque pillars of singular elegance alternate with clusters of slender shafts, all bearing small round arches. The whole is of striking beauty. The capitals are quaintly sculptured, and some of the pillars have carvings in relief. It is pretty certain that this is one of the oldest, if not the oldest, pieces of Romanesque architecture in Germany. Walter von der Vogelweide, the celebrated German mediæval poet, was a canon of Würzburg about the year 1230, and probably often traversed this cloister. In the exploration of the site, which was at once carried out, a stone sarcophagus was found close to the spot where it is recorded that he was buried. In it were some fragments of a skeleton. Time had effaced whatever inscription the lid once bore, and there was nothing within to identify the tenant. Imagination at once declared these bones to be the remains of the famous Minnesinger. But a scientific examination decided that some of them belonged to a young man, some to an old man; even some skull fragments were shown not to have been portions of the same skull. It ought to be enough for lovers of art to know that they are here in presence of a most interesting monument of the earliest German Christian architecture, and that the feet of the sweet poet must have often passed over its flags.

GENERAL.

Messrs. H. Saxon Snell & Sons, architects, Southampton Buildings, Chancery Lane, have dissolved partnership as far as regards Mr. H. Saxon Snell.

Mr. H. Percy Boulnois has been presented with a testimonial on his resignation of the Surveyorship of Exeter. It consists of an epergne specially designed, and a solid silver tray.

The Exhibition of Water-Colour Drawings by modern artists was opened on Tuesday in the Corporation Picture Gallery at Brighton.

The Plans of Mr. W. Lister Newcombe, of Newcastle-on-Tyne, have been selected in competition for a Presbyterian church to be erected in Harrogate.

The Exhibition of Modern Paintings in oil and water-colour opened at Southport on March 10 was closed on Saturday last. About 160 works have been sold, realising in the aggregate over 2,500*l*.

Earl Percy, M.P., has accepted the office of president of the Royal Archæological Institute, which lately became vacant by the death of Lord Talbot de Malahide. The annual meeting will take place at Lewes on July 31, under the presidency of the Earl of Chichester.

Miss Isabella Bewick, the last surviving member of the family of Thomas Bewick, the celebrated wood-engraver, has just died at Gateshead, at the advanced age of ninety-three.

The Lord Mayor of York on Tuesday opened the Ebor Buildings, two blocks lately erected in that city to serve as artisans' dwellings.

The Rochdale Town Council have decided to erect a spacious one-storey stone building, at a cost not to exceed 4,500*l*., for the purpose of a public library.

Mr. Walter Stanton, of Chesterfield, was on Wednesday appointed borough surveyor of Chesterfield, out of sixty-eight applicants for the post.

The Summer Exhibition of the York Fine Art and Industrial Exhibition was opened on Tuesday by the Lord Mayor of York.

The Parish Church of Asgarby, near Spilsby, is said to be the smallest in England, the interior dimensions being 24 feet 7 inches by 17 feet.

The Bristol and Gloucestershire Archæological Society will hold their annual summer meeting at Bath, beginning on July 31.

Weaver Church, Winsford, having subsided at the north-east corner, has been "lifted." This is the third time the church has had to be raised since it was rebuilt.

A Lady residing in the neighbourhood of Stratford-upon-Avon has given 6,000*l*. for the purpose of erecting a new infirmary in that town.

Messrs. Chinnock, Galsworthy & Co. will on Tuesday sell by auction, in twenty-seven lots, an important building estate at Wimbledon. It contains about 452 acres, and the land is entitled to be styled "the most eligible building land in the market within the metropolitan area."

The Collection of Pictures belonging to Sir Philip Miles, of Leigh Court, near Bristol, has, it is stated, been purchased by Mr. Mackay, of Paris. The collection includes *The Logos*, ascribed to Leonardo da Vinci, and a number of examples by Claude.

The French Minister of War is stated to be willing to agree to the removal of a small portion of the Paris fortifications—that between Point du Jour and the Seine; but he insists on the maintenance of the remainder. Contractors have offered to level this portion, and to fill up the ditch, on condition of possessing the old materials.

The Ormskirk Board of Guardians are about to erect new children's industrial homes and schools at Ormskirk, from plans prepared by Mr. Thomas Kissack, of Ormskirk. Extensive alterations and additions are about to be made at the Ormskirk Workhouse also, according to plans prepared by Mr. Thomas Kissack.

Sanitary Assurance Association.—At a meeting of the Council of the Sanitary Assurance Association on Monday, the following resolution, recently passed by a meeting at 9 Conduit Street, W., was considered, viz.: "That the Council of the Association be requested to consider whether they cannot recommend legislation compelling the builders of all new dwellings to obtain a certificate from some authority or qualified person as to their sanitary condition before it shall be lawful for such buildings to be inhabited." On the motion of Professor Hayter Lewis, F.S.A., seconded by Professor Corfield, M.D., a sub-committee was appointed to consider how best the object of the resolution may be attained, and, if desirable, to draft a Bill and report to the Council.

FRIEZE IN CHURCH OF ST. GENEVIÈVE [PANTHEON] PARIS.

By M. PUVIS de CHAVANNE

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 16, 1883.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

COMPETITIONS OPEN.

NEWCASTLE-ON-TYNE.—July 4.—Designs are invited for a Police Station and Fire Brigade Station to be Erected on the site of Westgate Police Station. Mr. Hill Motum, Town Clerk, Town Hall, Newcastle-on-Tyne.

NEWCASTLE-ON-TYNE.—July 30.—Designs are invited for a Hospital for Infectious Diseases to be built on a Site near Heaton Junction. Subject to certain conditions, the successful Architect will have the carrying out of the work, and a premium of 50% will be divided between the second and third competitors. Mr. Hill Motum, Town Clerk, Town Hall, Newcastle-on-Tyne.

YEOVIL.—July 1.—Designs are invited for Swimming Baths, &c. The Borough Surveyor, Yeovil.

LEATHER, PARCHMENT, AND GLUE WORKS, STOURBRIDGE.

The Architect.

ON THE DESIGN OF DOMES.

HE Dome, the Spire, and the Portico are probably the three grandest features that architectural fancy has produced; and of these three we may say the dome is the one which, both artistically and structurally, is the most majestic of all—perhaps of all possible conceptions. And yet, strange to say, although no doubt there are examples of one sort and another all

over the world, there are so many that are of little account and so few that are of much, that the design and construction of domes may be regarded as a subject that has never been cultivated as it ought to have been.

The dome, properly so called, is not a campanile with a hemispherical roof. Neither is it a tower with a hemispherical roof. Neither is it a hemispherical frame of woodwork or ironwork—one might almost say a cage of wickerwork—faced with sheet lead, or, as some are, slated with slates. It is a great hemispherical vault of masonry or nothing, covering its circular area in pure and simple form within, and presenting to outward view, in the same pure and simple form, a stately crown—the Crown of all Building—rendered impressive perhaps to the utmost by finesse of ornamental detail, for which it offers every inducement to the decorative fancy, yet depending upon nothing for its genuine majesty but that unsophisticated virtue of calm, heroic power and ineffable repose which is the supreme characteristic of the noblest works of man, as of Nature.

Some twenty years ago, or less, the late Sir GILBERT SCOTT used to tell us that he had been a good deal exercised throughout his lifetime in considering the question why there should not be a Gothic dome. Indeed he exhibited one or two notable endeavours to show, at least on paper, what he would make of it. But what he would have made of it was little more than a dome of St. Paul's, or of the Paris Invalides, seen from without alone, nicely covered with little pointed arches, little buttresses, little pinnacles, tracery, crockets, crosses, and so forth, and the whole brought to a very sharp point at the summit, as everything Gothic ought to be. Of inside organisation, to all intents and purposes, it had none. The Gothic of it was but detail: just as, when Mr. BERESFORD HOPE about the same time affirmed that our theatres ought to be Gothic, he saw with his mind's eye only the superficial embellishment of the house—notoriously made up of papier-maché, silk curtains, gold leaf, and paint—and cared no more for construction than the scene-painter. Those who, without being Gothic, or for that matter Classic either, know what a dome is as a substance and not a shadow, do not require to hesitate a moment in answering Sir GILBERT SCOTT's question. The dome is simply the culmination of vault-design, and is therefore the proudest essay of whatever school of architects may be competent to use the vault to the best advantage. Thus it has been in turn the glory of the Romans, of the Byzantine Greeks, of the Romanesque Goths, of the Orientals, and of the Cinque-centists. But we may as well acknowledge at once that a proper dome requires something that the Western Goths do not appear to have possessed.

Some years ago Sir EDMUND BECKETT read a paper at the Institute of Architects upon the "Construction of Domes," treated mathematically. The subject was indeed treated in a manner so entirely mathematical, that the author, in his frank way, told the meeting he would skip over the algebraical part, and leave it to be printed in the Transactions, because there was only one member of the Institute who could understand it, meaning Mr. PENROSE—whose attainment of the honour of Royal Gold Medallist on this same ground we take the opportunity of recognising with great pleasure. The theory which Sir EDMUND developed was of course—like the ordinary theory of the arch—based entirely upon the equilibration of a vault of loose stones. His object in the design of any dome upon the principles thus developed would simply be to determine the proper section upon which the domical structure, if, as mechanicians say, "free to move" throughout, would be kept

at rest by the balance of its own statical forces. It is of no use to inquire what this theory involved, or what was the outcome of it. As a mathematical exercise it was no doubt admirable; but the simple fact is that we do not build domes in that way; we do not build domes of loose stones, and it would not be worth our while to try.

Let the reader look at the well-known section of the dome of St. Paul's, London, and he will find therein a particularly instructive lesson in respect of both dome-construction and dome-design. Sir CHRISTOPHER WREN had for his object something peculiarly complex. He desired to have a dome as an internal crown to his composition. He desired also to have another dome as an external crown. Again, he determined to place upon the summit of this a lantern. Great altitude externally was, lastly, the chief consideration. Accordingly he was led, in the first place, to carry up the external dome to a height out of all proportion with his internal dimensions; secondly, to add to this height very considerably more in the form of the lantern; and, thirdly, to make his internal dome, although far lower than the external, as high as he could permit himself to have it. Therefore, although he was able to build his internal dome satisfactorily enough, he had to build over it a lofty concealed cone to carry his lantern; then he had to "make out" the external dome to the desired form by means of timber framing resting on this cone; and finally he carried a peristyle round the base of this wooden cupola, for the sake of exterior proportion, which is quite independent of any connection or correspondence with the features of the interior. The general effect externally is exceedingly graceful, but the dome which is thus seen without is no dome; the only dome is that which is seen within. The structure as a whole may be best described as a central tower of circular plan, surmounted by a wooden cupola-roof, with a lofty lantern of stone appearing through the summit of this as a spirelet, and supported in some way not apparent. The dome of St. Peter's at Rome, on the other hand, is one properly so called. It is not a tower in any sense; the peristyle is comparatively small and quite subordinate as a mere base to the legitimate cupola; the features of the exterior and the interior correspond exactly; the lantern is short and light, and in no sense a spirelet or pinnacle but a proper enclosure to the eye of the vault; and if there are two shells, as there are, they are both proper domes of masonry, and are only a few feet apart, the outer protecting the inner from the weather, and both combining as one to carry the lantern. To the mind of the artistic philosopher the contrast between Sir CHRISTOPHER WREN's construction and MICHAEL ANGELO's is most significant, and the comparison of their artistic motives no less so. In the one case simplicity reigns throughout in sublime repose; in the other nought but affectation, delusion, and disguise. In the one the product of very little ingenuity is a dome on the most magnificent scale; in the other the result of artifice upon artifice is something critically indescribable, very elegant, no doubt, but architecturally no better than the Lord Mayor's cocked hat.

Now the proper construction for a dome, or hemispherical vault of masonry is, in plain words, to build it in rings. No matter how great the diameter may be, let the drum or circular base-wall be first made firm as a foothold, and adequate to carry the intended vertical weight, and so far all is safe. Then build the first course all round as a ring, and it manifestly furnishes its own tie. In the East the mason appears to be able as a rule to rely upon the strength of his cement; we however, should never do so; we should probably in every case provide chain bond in one form or another, even if only to be secure against slipshod work. At any rate, our first ring is in itself completely immovable. We then build upon this, and in precisely the same way, the second ring; and so with the third and each succeeding one; every one is its own tie, and lies with only dead weight—no thrust whatever—upon the one below. At length the top is reached, by ring upon ring, and it is plain that no centering has been required, however great the span. The "eye," however, is left open for lighting, and a lantern of some sort, and of some weight, will generally have to be constructed around and over this. It must obviously be made as light as possible, for it is an abnormal load on what may be called the weakest part of the vault. But, after all, it is only to be regarded as an addition to the whole load which the dome constitutes; and theoretically it involves only so much additional strength in the chain bond for its resistance. It scarcely needs to be observed further that the section of the domical vault ought to be equilibrated—that is, decreased in

thickness gradually as it ascends; and it is equally plain that, the more substantial the thickness is throughout, the stronger will be the structure in withstanding the cumulative strain of time. The chain bond, of course, we assume to be efficiently devised; and equally of course, its tensile strength at each stage bears a recognised proportion to the diameter of that ring.

The well-known dome of the Greeks, although constructed with level instead of radiating courses, was built on a similar principle, each course being a complete ring; but, as an underground structure, the Treasury of Atreus required nothing like the chain bond, or its equivalent, of an ordinary dome. The conical iron roof of the Vienna Exhibition Building, also, exemplifies the principle in another way, the iron reticulation being in the same form of successive rings, each furnishing its own tie.

We hope we have said enough upon this interesting subject to lead the more ambitious amongst our architectural designers to turn their attention to the dome on a large scale and in legitimate form, not only as a problem in magnificent construction, but, we need not say, none the less as an opportunity for attempting the development of artistic grace in many modes which endeavour will suggest.

FRENCH PAINTING.

[BY A CORRESPONDENT.]

THE remarks which have been expressed by English artists, professional critics, and amateurs, upon the works which are on view in the Dudley Gallery, suggest that less is known about the art of the painter as it is now practised in France than was anticipated by the promoters of the exhibition. To many, if not to the majority, of the visitors, the paintings in that gallery appear to want beauty—the quality which is supposed to be most essential to a work of art. The figure subjects, it is said, mostly represent ugly people, and the scenes shown in the landscapes have nothing that is picturesque about them. If the pictures were exhibited together in such another gallery in Paris they would be estimated differently. We do not say that they were certain to secure general admiration, or that the critics would be unanimous in expressing opinions upon them, but there is little doubt that whatever faults might be found in the pictures the absence of beauty would not be one of them. How is the difference between the taste of England and the taste of France to be accounted for? Does it arise from the existence of two ideals of beauty, or are the French people not so keen as the English in discerning marks of ugliness? To answer these questions it will be necessary to glance over the history of painting of late years in France.

The condition of painting during a great part of LOUIS PHILIPPE's reign may be understood from the pleasant letters of THACKERAY, who was then an art student. The influence of DAVID (or rather of a fashion which he followed) still prevailed, and art was nothing if not classical. There were, we are told, in those days endless straight noses, round chins, long eyes, short upper lips, like the figures ruled in drawing-books, but the severity was so perfect, that to a realist like THACKERAY of the examples exhibited in the Beaux-Arts scarce one was worth more than half a crown. "What a classicism," he exclaims, "inspired by rouge, gas-lamps, and a few lines in 'Lemprière,' and copied half from ancient statues and half from a naked guardsman at one shilling and sixpence the hour!" That the fashion was a sham, which oppressed artists while they ministered to it, is evident from the facility with which even DAVID undertook work of another kind. He must have felt, as many have felt since, that the portrait of his washer-woman was a happier effort, worth a score of historic works in which long-legged Romans gyrated.

The classicism of the picture gallery corresponded with the classicism of the stage; and when CORNEILLE and his fellow big-wigs were found to be unable to resist the first efforts of the romanticists, it was evident that their representatives in painting must also succumb. A film was removed from men's eyes, and they saw a world of wonders. HORACE VERNET with scenes of Eastern life, DELACROIX with his daring experiments in colour, DELAROCHE with his history-pieces, made the old sublimities appear, if possible, more false to nature than they were.

But with all their virtues, the new works were almost as remote from the France of the nineteenth century as the scenes from the legends of ROMULUS and the CURIATII. Neither figures nor faces represented living men and women. The first man whose works were racy of the soil was undoubtedly MILLET, who left DELAROCHE's studio as he entered it—a peasant in heart and soul, without the least ambition to follow his master in illustrating scenes of English history. He believed it was necessary to understand a thing before painting it; and as he had no opportunity of observing the life of courtiers, he substituted another form of life, which he knew from painful experience. By depicting men and women who in form and countenance, as well as in garb, resembled the peasants that were to be seen every day toiling in the fields, he accomplished a revolution which in its effects on art may be compared with the literary revolution of that other peasant, ROBERT BURNS. Before MILLET's appearance, art, with the exception of some of the Dutch works, and those by HOGARTH and WILKIE, exemplified the proverb that one half of the world never knows how the other half lives. The great Greek works, what do they reveal to us of the mass of the people? Few who look at the Panathenaic frieze know what cruel things were done to the slaves who cultivated the lands and tended the olive trees, by fine gentlemen like those who ride so gracefully in the procession, or can guess what tyrants were ladies who in public were as demure as those who accompany the embroidered veil. Take a much later age, and consider the representations of life which were given by WATTEAU. Who would suppose that, co-existing with his delightful arcadian shepherds and shepherdesses, there were men and women in French fields whose lives were as dreary as if they had been born Greek slaves? WATTEAU paints most lovely distances, but in none of them can we find any signs of the storm that was about to burst on France. To artists of his type life is an everlasting *fête champêtre*, and no thought is given to the wretches who happen to be outside the park. MILLET was one of the excluded, and it was well he was, for he secured the recognition of the French peasant. People who had been admiring the Court beauties and capacious crinolines of WINTERHALTER were compelled to find an interest in toil-worn men and women, or at least in representations of them, and in their prosy occupations. MILLET's experiment was repeated by the painters of town life, and with many of them it was no less successful.

English painters have hardly ventured so far as the French in the representation of facts. What, for example, are most of the late FREDERICK WALKER's peasants but Greek heroes clad in corduroy? The peasants of Mr. FILDES are, in their way, no less un-English. Would anyone who lived for a year or two in a country village invent figures like those which are seen in the tawdry wedding scene now in the Royal Academy? With so many works of an imaginative class before them in their own collections, it is not surprising that French realistic works are little appreciated by the English people. The foreign pictures appear strange to us because they are compared with pictures which are more or less conventional. We admire realism in literature, but the illustrations of the words, whether on canvas or on paper, must possess fictitious qualities.

The French peasant is unlike the *Apollo Belvedere*; he is without hyacinthine locks, and is not so graceful as the herald MERCURY. MILLET made many hundreds of drawings from Greek statues, and he was aware of the differences between those ideal forms and the bodies of his countrymen. But the defects were there before his eyes, and to substitute something else for them was to MILLET an absurdity which could only be paralleled by his introducing Alpine heights among the level fields which he loved to paint. It is not impossible that some of his followers have endeavoured to be more naturalistic, and remembering the failure of the classic school, allowance should be made for them; but, speaking generally, French painters are true to life, and if the faces in their pictures are not always pleasing to English eyes, the responsibility must be assumed by nature. It should also be remembered that some of the greatest painters have been averse to representing mere prettiness. MICHAEL ANGELO, MANTEGNA, BOTTICELLI, HOGARTH, ROSSETTI, are a few of those who preferred faces with contours that did not correspond with the standard of a modern book of fashions, or of the professional beauties. The drawings of DA VINCI are also evidence of the fascination which ugliness of an extreme kind exercises on the mind of a great painter.

It will be said that the subjects selected by French painters are also unsatisfactory according to English notions; they approach, it is said, too often to what is horrible. Such a picture as the *Slaughter of the Trojans*, which was exhibited in the late Salon, would be inadmissible to the Royal Academy. The question is, however, whether pictures of the kind are outside the province of painting. An historian would not incur the charge of bad taste if he described circumstantially the vengeance of the Greeks when they captured Troy, and M. ROCHEGROSSE can claim the authority of HOMER for details which are as terrible as those he has depicted. Is the painter to suggest that war is a ceremonial in which nothing more dangerous than rose-water is employed? Is he to show its pride, pomp, and circumstance, without expressing the pain which accompanies it? To judge from what is said by the critics, it would seem that, as Mr. ESMOND said, the murder of a campaign is done to military music, like a battle at the opera, and the virgins shriek in harmony as the victorious grenadiers march into their villages. The writer, on the contrary, is expected to harrow up men's souls with the most terrible incidents. M. ROCHEGROSSE has tried to realise what a war of Greeks and Trojans was, and his work is condemned because it is not as pleasing as a distribution of standards in the Champs-Élysées. We have selected this work as it is a prominent example, and, in spite of the critics, has been honoured by a majority of French artists: It manifests in the strongest way the defects that are ascribed to French painters; but so long as there is one rule for writers and another for artists, the objections to a work of this kind can never be convincing. In literature it is an accepted maxim that "terror is the source of the sublime"; is the French painter to be blamed because he seeks to discover how far the maxim is applicable to his art? He finds himself in a world in which he cannot open his eyes without seeing terrible things, but because there are squeamish people, some of whom have concocted theories of æsthetics to suit themselves, he is expected to turn away from everything which those people consider to be inelegant and unrefined. The French artist is too fond of liberty to allow himself to be bound to give them pleasure. Their old-fashioned canons are ill adapted to our day; they have been found wanting in literature, for if they were obeyed such writers as DICKENS, CARLYLE, MACAULAY, BROWNING in England, and almost every modern writer in France, must have been condemned, as in a past age SHAKESPEARE was condemned. Even GOETHE, although far from being narrow-minded, could not endure VICTOR HUGO's "Notre Dame," because some of the characters were tortured, and others did not belong to the cultured classes. The true canon, which is equally applicable to poetry and painting, and is in unison with the most advanced thought of the nineteenth century, is shadowed forth in some essays by LEOPARDI, of which Mr. GLADSTONE gives the following account:—

In a letter to GIORDANI of May 1817, he (LEOPARDI) controverts a doctrine of the latter with respect to art. GIORDANI had admonished young painters never, without an overruling necessity, to represent what was ugly, and then with tact and reserve, inasmuch as the proper business of art was with beautiful and winning not with distasteful objects. No, says LEOPARDI, their office is to imitate nature *nel verisimile*. And he argues thus: The same general maxims, he conceives, that govern poetry must also hold good for painting. But in poetry, if GIORDANI were right, it must follow that HOMER and VIRGIL had erred times without number; DANTE above all, who had so often represented *il brutto*. Storms, deaths, other calamities are distasteful, but the poets are full of them. Again, tragedy must be radically, and of its own nature, bad. But in the tears, agitation, shuddering caused by the perusal of poetry, there is real and keen delight, which springs from the vivid imitation and representation of nature, as it brings before us and fills with life what is distant or dead or purely imaginary. Hence, while the beautiful in actual nature only gives a limited, that of art, having a power not bounded by fact and experience, gives an unlimited delight; and even what is ugly acquires the power to please, provided it be represented according to the *verisimile* or probable in art.

The works of a great many French painters might be supposed to have been inspired by the arguments of LEOPARDI. Their pictures, while showing what is apparent to all who are not afraid to look, suggest some of those forces which are below the surface of our commonplace life, and which some day will astonish the world. In England people congratulate themselves on the absence of such subjects, but M. ROLL and

his friends have not depicted more painful scenes than are to be witnessed every day among Sheffield grinders, in Lancashire mills, and in London streets.

PARIS NOTES.

A SUIT of interest to both artists and picture buyers has just been heard before the Paris Civil Court. M. Jean Béraud is a well-known painter of scenes of Paris life, and had two works in this year's Salon. Counterfeits of his pictures have become common in the Paris market, but all his efforts to discover the source of them had been fruitless until accident placed him on the traces of the perpetrators of the frauds. In May of last year M. Béraud was doing his thirteen days' military service as a reservist, when he found himself thrown into the society of M. Audoin, son of a Paris solicitor, and a M. Raux, who described himself as a picture dealer, they all serving in the same regiment. In the course of conversation one day Audoin casually remarked to Raux that he would like to have a picture by their companion Béraud. The latter instantly replied that he had one in Paris to sell, and an appointment was made to see it on their return. Audoin subsequently called and saw the painting, but remarked that it only bore the initials, J. Bd. Audoin asked to have the picture left with him for a few days, to which Raux consented, and then resolved, presuming on his acquaintance with Béraud in the regiment, to request the artist to complete the signature. Béraud acceded to the proposal, but on seeing the work at once repudiated it. It was, in fact, a partial imitation of one by Béraud, representing a scene in the neighbourhood of the Montparnasse Cemetery, and which is well known from engravings. M. Béraud naturally determined to follow up the clue, and Raux, on being questioned as to the origin of the picture, promised to introduce to him the person from whom he had purchased it. An appointment was made, and Raux brought to Béraud's study a female whose features were concealed beneath a thick veil, and who protested that the painting had been given her by a gentleman. This explanation did not, however, appear satisfactory to M. Béraud, and, as M. Raux refused to afford further satisfaction, an action was brought to recover damages for the prejudice caused to his artistic reputation by these frauds. The defendant could not deny that the picture was a counterfeit, but pleaded that he himself had been deceived, and that he was a victim of his discretion in refusing to give the names of the parties from whom he had received it, as by so doing he might compromise a lady. The Court found that, such being the case, he must submit to the consequences of his chivalrous behaviour, and condemned him to pay 500 frs. damages. The spurious picture that gave rise to the suit was further ordered to be handed over to M. Béraud.

There has just been affixed to the river-side wall of the Châtelet Theatre a plate bearing the following inscription: "The painter Louis David, who died in exile at Brussels on December 29, 1825, was born in a house on the Quai de la Mégisserie, April 30, 1748." David was buried in the cemetery of Evere-lez-Bruxelles, but it is not generally known that his heart was secretly transported to France. According to Dr. Chalups, who made a post-mortem examination and embalmed the body, this organ had swollen, through hypertrophy, to double its proper size, and weighed upwards of a pound and a half.

M. Henri Gervex, the painter, and M. Carrier-Belleuse, the sculptor, have entered into a contract to execute, within two years, an immense panorama, reproducing an episode in the life of every celebrated Frenchman of the present century—statesmen, soldiers, *savants*, and artists. The price to be paid for this gigantic work is 500,000 frs.

The success that attended the late "Exposition des Portraits du Siècle," which yielded upwards of 100,000 frs. to the charity for which it was organised, has induced the Paris Philanthropical Society to hold a similar exhibition next year. Many offers and promises of pictures have already been received from collectors, and the committee appeal to all amateurs to help their charitable work by making the show of portraits in 1884 even more striking than this year.

A new panel by M. Th. Maillot has lately been uncovered on the right hand side of the Saint Geneviève Chapel in the Panthéon. In this work the artist has depicted "the people of Paris in 1130, during the reign of Louis le Gros, repairing in crowds to the

cathedral, under the guidance of Etienne, their bishop, to implore their patroness, Ste. Geneviève, to deliver them from the epidemic (known in French as the *mal des ardents*) which was then ravaging the city." In the foreground is seen the procession of clergy, followed by the populace, and above this a view of the side galleries of the sacred edifice.

Several Paris papers have announced that some English firms are endeavouring to transplant the manufacture of Aubusson tapestry to England. Commenting thereon, a provincial journal, the *Démocratie Creusoise*, remarks that the mischief (from a French point of view) has already been done, for the condition of the trade in France has of late years been so unsatisfactory that between 1879 and 1882 about twenty families were compelled to cross the Channel to find work, and have carried the secret of this branch of French art industry to Windsor.

It will be remembered that the late Baron Charles Davilliers left by will his valuable literary and artistic collections to the country, and the various museums to which they are destined have now received notice from the notary charged with the carrying out of the will to take possession of them, as follows: the Louvre, all the works of art, plate, ivories, tapestry, and furniture; the Sèvres Museum, the porcelain and pottery; the National Library, all the books and manuscripts.

The former Tennis Court at Versailles, in which the first sittings of the National Assembly were held in 1789, has now been completely restored and converted into a museum. It was opened to the public on Wednesday, the 20th inst., by M. Jules Ferry, the Prime Minister and titular head of the Fine Arts Department, a banquet being given by the municipality of Versailles in honour of the occasion.

The Pont d'Austerlitz is to be widened from 18 to 30 mètres, at an estimated cost of 1,700,000 frs. The work will be commenced at once.

It has been decided to take advantage of the July 14 National fête to unveil the colossal statue of the Republic now being erected on the Place de la République. The sculptors are engaged in finishing the monumental pedestal upon which the statue will stand. This pedestal is decorated with twelve bas-reliefs, representing the National Fête, the Proclamation of the Republic, the Oath in the Tennis Court at Versailles, and the Taking of the Bastille. The statue itself is 25 feet 6 inches high, and weighs upwards of 12 tons, but notwithstanding this great weight, arrangements have been made whereby it can be transported to the square and raised to its place in one piece. The lion reposing at the feet of the statue is 13 feet long.

THE SITE FOR THE NEW LIVERPOOL CATHEDRAL.

THE following is the report prepared by the Special Sub-committee giving particulars of the available sites for the proposed new cathedral:—

The Special Sub-committee to whom you entrusted the duty of collecting facts bearing on the subject of a site for the proposed cathedral have applied themselves to the task with earnestness, and, they venture to hope, with some measure of success. In their investigation they were materially assisted by Mr. Shelmerdine, the borough surveyor, and by Sir James Picton. They had also the advantage of the knowledge possessed of land and buildings by Colonel Wyatt and Mr. Hale, and a letter of suggestions from Mr. Lyster, of the Dock Office. To all these gentlemen, and to others who rendered valuable assistance, they beg to tender their best thanks.

The first point of importance was one in which Sir James Picton and Mr. Shelmerdine thoroughly concurred—viz., that the area sought for should not comprise less than 10,000 yards, and that the length of the edifice from east to west should not be less than 300 feet. Other considerations were not forgotten—e.g., that the situation should be public and central, and that the building should, if possible, be open to view on at least three sides.

But a very important element in the consideration of every site suggested was its probable cost, in case it required to be purchased in whole or in part. It was stated that land covered with buildings could not be procured for less than from 8% to 10% per yard; while in some instances that amount would be nearly doubled. Land which is not covered by buildings is very rare within the city, or of limited extent; so that a sufficient one could only be found at a considerable distance from the present centre. It was hoped that some of the churchyards of the town, now practically disused, might have served the purpose; but it has been found that only one possesses the requisite space.

Whatever may be the site selected, due attention must be paid to its probable condition in the future, for one might be deteriorated by the class of buildings which would rise around it, while another might be improved in an equal or greater degree; so that even when a preference is given to a few sites—say two or three—the public must not regard their present condition as a correct indication of what any of them will be even a few years hence.

The number of situations suggested as suitable have been about twenty in all, but some of them did not require detailed consideration. So many as fourteen, however, have been examined with great care, and the table annexed, which is taken from Mr. Shelmerdine's plans and private information, contains details respecting each. The fuller information and the last five of the suggested sites have been put on record since the table was arranged.

Tabular Statement of Sites.

	Area in square yards.	Length in feet E. to W.	To be Purchased or not.	Can it be added to?
St. John's Churchyard	15,300	450	Free, subject to an Act of Parliament.	No.
St. Peter's Churchyard	6,800	290	Do.	No.
St. Luke's Churchyard	5,450	295	Do.	No.
St. James's Cemetery	69,100	{ 250 } { 540 }	Yes.	No.
Myrtle Street (Mr. Hope's Land)	4,500	290	Yes.	No.
St. Mary's Cemetery	9,250	250	Partly.	Perhaps.
Abercromby Square	8,800	330	Yes.	Yes.
Falkner Square	7,800	390	Yes.	No.
Sheil Park	72,500	780	Yes.	No.
Islington and Christ Church	7,680	260	Yes.	Yes.
Monument Place	9,480	340	Yes.	{ Yes, if necessary.
Workhouse	54,750	650	Yes.	No.
George's Dock	39,600	500	Yes.	No.
Kensington Fields	502a.	1,500	Yes.	—

Remarks by the Borough Surveyor.

The following supplementary information, contributed by Mr. Shelmerdine, is added to the report:—

St. John's Churchyard.—This site has a total area of about 15,300 square yards, and from east to west an extreme length of about 430 feet. The present church was erected under an Act of Parliament obtained in 1762; it was not consecrated, however, until 1783. There are some 2,572 gravestones, and in the event of the cathedral being erected here about one-half of these would have to be interfered with. As regards the area, it would be quite practicable to erect an edifice here with a length from east to west of from 300 to 390 feet. It is to be mentioned, however, that a difficulty might arise with the Corporation as to the advisability of the site being appropriated for the purpose, as it may be considered that it should be reserved in order to leave open the western side of St. George's Hall. There is also the question as to the desirability of erecting a cathedral in such close proximity to buildings in the Classic style of architecture, taking into account that Gothic is the prevailing style for church purposes. It should also be remembered that if erected on this site the edifice would be completely hidden from the most important of the surrounding thoroughfares by St. George's Hall, and also that should the high-level roadway be constructed in William Brown Street, the low-level street between the bridge and the site would be anything but an advantage. The level at the north-eastern corner of the site is about 22 feet above that at the north-western corner, and the cost of levelling this, should it be considered desirable, would be about 4,500*l*. With regard to the graves, the cost of removing the contents may be set down at about 12*l*. per grave. The subsoil is yellow, friable sandstone. The extreme height of St. George's Hall is 115 feet or thereabout.

St. Peter's Church, Church Street.—This site contains about 6800 square yards, and from east to west is only about 290 feet. Assuming, therefore, that the committee propose to select a site suitable for the erection of a cathedral of not less than 300 feet from east to west, this one is out of the question. As to extending the site in the directions mentioned, this is practically impossible, owing to the extremely valuable properties adjoining and the large businesses carried on. The number of gravestones in this case is about 2,000. There would not be any material difficulty with regard to the levels.

St. Luke's Church and Leece Street.—This site, as suggested at the last meeting, would be bounded by Berry Street, Leece Street, Rodney Street, and Bold Place, and have a total area of 9,250 square yards, with a length of about 480 feet from east to west. To obtain this area it is proposed to utilise the site of St. Luke's church and yard, containing about 5,450 square yards, and to acquire and add thereto certain properties in Rodney Street and Roscoe Street, covering an area of about 3,800 square yards. It is also proposed to acquire a further plot in Rodney Street, containing about 780 square yards, for the purpose of continuing Bold Place into that street. The property proposed to be acquired consists mainly of valuable dwelling-houses fronting to Rodney Street, and in order to do this it might be necessary to obtain an Act of

Parliament. The cost of getting in this property would probably not be less than 20,000*l*. The site would no doubt be a fine one, affording room for a cathedral of imposing dimensions, and the neighbourhood would be all that could be desired. The subsoil is friable sandstone. The difference in the levels is about 27 feet.

St. James's Cemetery, &c.—This site, including St. James's Walk and the Mount Gardens, would contain about 69,100 square yards, and the extreme width from east to west would be 540 feet. A great part of the Mount is made ground; the subsoil is yellow friable sandstone. It would be possible to place a cathedral at the north end of the cemetery without interfering with the Mount, which is Corporation property; but should it be desired to place it on any other portion of the cemetery land the Corporation would have to be arranged with, as the distance from east to west would be insufficient. The difference in the levels between Hope Street and the north-west corner of St. James's Road is about 20 feet.

Hope Street.—This site consists of a piece of land on the south side of Myrtle Street, and bounded on the other sides by Catherine Street, Caledonian Street, and Sugnall Street. It contains altogether only 4,500 square yards, and has a length from east to west of 290 feet only. It is therefore, from its dimensions, somewhat unsuitable as a site for a cathedral. Its only recommendation appears to be that it is open on the four sides. The subsoil here, also, is yellow friable sandstone.

St. Mary's Cemetery, Mulberry Street.—This site, as suggested, consists of St. Mary's Cemetery, now used as a public recreation ground, the stone-yard between it and Arrad Street, and the property between Arrad Street and Hope Street, the whole containing about 19,410 square yards, and having a length from east to west of about 630 feet. The subsoil is dry red sandstone. St. Mary's Cemetery contains about 9,250 square yards, and the stone-yard about 6,100 yards, and by taking these two pieces alone a length from east to west of about 490 feet could be obtained. It is impossible to get an opening into Myrtle Street without acquiring either the Eye and Ear Institution, the Children's Infirmary, or the Gymnasium, which are all modern buildings. There would be no difficulty as to the levels.

Abercromby Square.—This site contains 8,800 square yards, and has a length from east to west of 330 feet. It has been suggested, however, that it is capable of being enlarged by acquiring the property on the east side of the square, and extending back to Vine Street, which would give a total area of 15,580 square yards, including the portion of the street absorbed. In the property suggested to be acquired, St. Catherine's church would be included, the rest being dwelling-houses. The cost of acquiring the whole of the property indicated would be about 19,000*l*., and should the church have to be erected on another site there would be an extra 5,000*l*. There are also thirty-four of the property-owners who pay 21*s*. per annum to the Corporation for keys to the square gardens; the Corporation would have to be settled with in respect of this, and the consent of the owners obtained to the extinction of their privilege.

Falkner Square.—This site contains about 7,800 square yards, and has a length of about 390 feet from east to west. The subsoil is dry red sandstone. From the dimensions last given it will be seen that the size is suitable. It is open on the four sides, and the neighbourhood is good.

Shell Park.—The contents of this site amount to about 72,600 square yards, with an extreme length from east to west of about 780 feet. This would give room for an edifice of the size thought of, say not less than 300 feet long, but it is extremely doubtful whether the consent of the Corporation to the closing of it could be obtained. The subsoil is clay.

Christ Church, Hunter Street.—It is suggested that to the site of the church and churchyard should be added the site of a block of property fronting Islington Flagg, and extending to Christian Street on the one side and to the new County Sessions House on the other. This would give a total area of about 7,580 square yards, and a total length from east to west of about 260 feet. The extreme length from east to west would be insufficient, and the cost of acquiring the Islington property would be very great. There is also the disadvantage that the railway tunnel from Edgell Station to Victoria Dock runs underneath.

Monument Place.—This site as proposed would extend from Monument Place back to Anson Place, and would contain an area of about 9,480 square yards. The length from east to west would be about 340 feet. It would be necessary, however, to acquire the buildings which now cover the whole of the site, and to absorb two streets. As the property in question consists in a great measure of valuable shops fronting Monument Place, Pembroke Place, and London Road, the cost would be exceedingly great, probably not less than 100,000*l*.

Workhouse, Brownlow Hill.—This site contains about 43,450 square yards, and has a depth from east to west of about 630 feet. The subsoil is yellow friable sandstone. The difficulty with regard to this site is, of course, the immense buildings already

upon the land, and the enormous expense that would consequently be incurred.

George's Dock, &c.—The Corporation have decided not to renew any of the leases of the warehouses in the block fronting what is known as the Gorce Piazzas, and as this block will sooner or later be demolished by the filling up of the George's Dock, a magnificent space would be formed. There is, of course, the difficulty as to the loss of accommodation by the Dock Board, but as the exigencies of the traffic must lead shortly to a demand for the filling up of the dock, it is just possible that, in view of this, upon proper representations being made, the Board might consent to anticipate the actual necessity in favour of such an object as that which the committee have in view. Assuming the baths to be removed, and the small basin at present in rear of the stage to be filled up as part of the arrangement, the area available between the buildings at the bottom of Water Street, &c., and the river would be more than sufficient for the cathedral proper, and in every respect suitable, being easy of access from all parts of Liverpool and from the Cheshire side, and in fact situate at the point of the city even now traversed by the great bulk of visitors. For a fine architectural effect probably this site cannot be surpassed, and being situate upon the margin of the river (and at the only point where practically the public have direct access to it), it would be a popular one, and one that in all probability would find favour with the section of the public which may be expected to subscribe towards the erection of the edifice.

Kensington Fields.—Kensington Fields of course comprises much more land than is wanted for the purpose in view, but no doubt the committee could purchase the quantity required. With such an area of land available, in addition to the edifice itself, space could be found for all the buildings usually required in connection with a cathedral. The total area of the estate is 50½ acres. There would be no difficulty as to the levels. The subsoil is red sandstone.

Great George Square.—In addition to other disadvantages, this site is deficient in length from east to west, being only 283 feet.

St. Michael's Church.—The same objection applies to this as to Great George Square.

St. Nicholas's Church.—This site also is too small, and the cost of acquiring any land in the neighbourhood would be too great for the matter to be at all entertained. It would be necessary to purchase up to Covent Garden, and the cost would probably not be less than 250,000*l*. The graveyard being full, the cost in respect of this would also be very considerable.

St. Mary's, Edge Hill.—This site is proposed to be formed by adding to the sites of St. Mary's church and yard the properties fronting Irvine Street, Upper Mason Street, and North View. This would give a total area of about 10,000 square yards, and a length from east to west of about 440 feet. The subsoil is dry red sandstone. The site would be open on the four sides, but the cost of acquiring the several properties would not be less probably than 20,000*l*.

Prince's Park.—The area in this case is 81½ acres, but as the use of the land as a park was secured to the owners of the surrounding dwelling-houses for seventy-five years from 1843, or until 1918, their consent would have to be obtained, as well as that of the Corporation, as owners of the reversionary interest.

STEETLEY CHAPEL, DERBYSHIRE.*

THE neighbouring village of Thorpe Salvin is said by some lovers of romance to be the celebrated castle of Front de Bœuf. If that be so, I maintain that Steetley Chapel is the ruined shrine where the Black Knight enjoyed the hospitality of "the holy clerk of Copmanhurst." Certainly, when "the gentle and joyous passage of arms of Ashby-de-la-Zouch" took place, this chapel had been standing nigh a hundred years. For it was probably built by Gley de Breton, when Stephen was on the royal throne of Westminster, and seated Roger de Clinton, thirty-third successor of St. Chad, on the episcopal throne of Coventry. It was the hand of a Clinton that first blessed this altar and these walls, and now, when seven centuries have rolled away, it is under the noble patronage of a Clinton that this altar and these walls have been restored. Steetley Chapel, then, is older than Welbeck Abbey. Gley de Breton built it perhaps for his own convenience as a private chapel to stand near his house; and no doubt Parson Hugh or Parson Walter used sometimes to walk down here from Whitwell early in the morning to say mass for the benefit of Gley, with his four sons and their sister, Matilda, and the Gurths and Wambas of his day. These four young men, if they married, left no children, and Matilda, becoming heiress, brought the property by marriage to the Vavasours, who held it till the year 1360. Thenceforward, and all through the Reformation period, it was held by the Frechevilles. From them it passed to the Wentworths,

* A paper by the Rev. G. E. Mason, read when the chapel was visited by the members of the Derbyshire Archaeological Society.

to the Howards, and to the Pelham Clintons. Although for some 200 years this building remained as a "capella" in Whitwell parish, yet in the fourteenth century, while Roger Northburgh and Robert Stretton were Bishops of Lichfield, nine separate institutions are known to have been made, and the priest is called "Rector of Steetley Church." This brief independence of forty years lapsed as mysteriously as it arose, and Steetley Chapel serves now once more the purpose for which Gley de Breton built it.

The chapel is 56 feet long. It is divided into three parts—a nave, a chancel, and an apse (a parallelogram, a square, and a semicircle). The nave is 15 feet 9 inches broad, and the chancel measures 13 feet 9 inches across. Mr. J. C. Cox has pronounced Steetley Chapel to be "the most perfect and elaborate specimen of Norman architecture to be found anywhere in Europe." The chief features of interest are the porch, the chancel, and the apse. Observe the porch. It is composed of a triple arch resting on three pillars. The inmost member of the arch is plain, the second and third are ornamented with the beak-head and with the zigzag design. On the pillars the sculptor has lavished his art. The inmost one is simply moulded; the next is very rich with deeply-cut interlacing foliage, and on the capital are two fish; the third is ornamented with picturesque medallions, and on the capital is a syren or a mermaid. It is not extravagantly fanciful to suppose that these three pillars represent the works of Creation, three steps in the progress of life. The inmost is inanimate; the second displays the wealth of vegetable growth; the third the activity of animal life—the sea-monster; the wild beast, the lamb of the flock, the man; and the flying eagle—that is, things "in heaven above, in the earth beneath, and in the water under the earth." This idea is visible on both sides of the porch. There is no doubt a further meaning in the medallions. Thus on the left side is plainly seen the good shepherd delivering the lamb out of the paw of the bear; on the right the figure of the pelican in her piety. Two new pillars have been added by Mr. Pearson on the old basement discovered. The carved stones lying on the grass may have originally belonged to the porch. They were found blocking up the lower of the two west windows. Outside the porch, right across the entrance, was found yonder priest's tombstone, and beneath the stone a skull. On the stone is carved an altar with three legs, and on the altar a chalice and paten, and a hand extended in blessing. At the head and foot is a sort of cross in a circle. There are two other stones: one plain, the other with a cross rudely scratched on it. Perhaps that unearched skull beneath the carved stone was part of the skeleton of Lawrence le Leche, who was instituted to Steetley the year before the great plague of 1349, during which 77 priests in Derbyshire died and 22 resigned. It is not difficult to imagine him, like Mr. Mompesson at Eyam, in 1666, refusing to quit his post, comforting the sick and dying or restoring them to health by that medical skill which had earned for him the title of "le leche." Then after seven years' service he died, and, in the humility of his self-devotion, chose, like St. Swithin at Winchester, to be buried before the porch, so that the people whom he had so faithfully served during his life might tread upon his bones as they passed within to pray. Dying, he left no name, no epitaph on his tomb, only a hand eternally to bless. It was a happy omen to find, when we began to restore, a holy hand that blessed us from the grave.

The chancel arch forms a kind of frame, through which the second arch and the lovely apse are seen. It gives an effect of solemn depth and rich beauty. The arch is triple. The inmost design is the zigzag, the next the battlement, and the third is an escalloped border over reticulated cones. The two pillars on the north side are richly carved, one with a double-bodied lion, the other with a St. George and the Dragon. The winged dragon, his long sweeping tail curled round the next capital and terminating in foliage, tramples on a prostrate lady. The warrior, in a complete suit of armour, strides to the rescue. His left hand thrusts a kite-shaped shield against the monster's mouth, and his right hand, grasping a long broadsword, is stretched out behind him to deal a death-blow. The chancel is paved with stone, as it was anciently. The aumbrey in the north wall contains a specimen of the stone tiles with which the chapel was once roofed. An old copper key, a piece of wrought-iron, and a silver penny of the reign of Richard II. are the only other things found here. In Lysons' "Magna Britannia" (vol. v., p. ccxxii-iii) are shown two doors opposite each other in the chancel, evidently cut for the convenience of the pigs or sheep that once lived inside. The Decorated window in the south side is the only feature later than the Norman period. The apse has a stone vaulted roof, supported by four ribs resting on engaged pillars. In the centre, where the ribs meet, immediately over the altar, is a medallion containing the "Lamb as it had been slain." The capitals of the pillars are elaborately carved. On the left is represented the tree of knowledge, loaded with fruit. Round it curls the serpent, and on either side stand Adam and Eve; an emblem of temptation and defeat. On the right are seen two doves; a symbol of peace after resisted temptation. The two together suggest and teach the wisdom of the serpent and the harmlessness of the dove. Some remains of the colour can still be seen on the capital of the south pillar of the arch. It would be a thousand pities to touch the carving with modern paint. It is painted with

the inimitable art and colour of the great master, Time. But the chapel needs colour and enrichment. And if the spaces between the ribs were tastefully decorated, the stone carving would appear to greater advantage. One word to suggest a scheme. Behind the altar is a reredos, representing the Crucifixion; in the central window, the Ascension; in the central space of the roof, Christ in Majesty, surrounded by the four living Creatures, the Angels, and the Saints after whom the chapel is named. Between the arch and the ribs of the roof is a semicircle, which surrounds and frames the vaulted roof. This is the "rainbow round about the throne in sight like unto an emerald," and it is composed of created things. In the summit the ranks of the angels, then the sun, moon, and stars, the clouds, lightnings, and storms, then the birds, then the beasts, the trees, the flowers, the water, and the fish.

It only remains for me to call your attention to the grotesque heads that surround the chapel immediately beneath the roofs, and also to the very beautiful string-course of carved foliage that girdles the apse immediately below the three exquisite little narrow windows. The chapel has not been re-consecrated. It was recon-ciled by the present Lord Bishop of Lichfield on November 2, 1880. As we moved in procession round the outside, we intoned the same psalm which was used by Bishop Hackett when he recon-ciled Lichfield cathedral after its desecration by the Puritans. If the spirits of the departed are able to understand what their descendants do on earth, then I think that Gley de Breton and Matilda de Vavasour and William de Mykall and Anker Frecheville and John de Bristowe and Hascuil Musard must rejoice to see the little shrine they loved saved from desecration and decay.

THE BRITISH MUSEUM.

THE annual report of the trustees of the British Museum shows that 767,402 persons visited the general collections during 1882, and a total of 963,867 visited the museum, including the visitors to the reading-room and other departments for study and research. The measure of giving expansion to the exhibition of works of art and antiquity by the separation of the natural history collections is on the eve of completion. The department of zoology may be expected to be established in the museum in Cromwell Road in the course of the summer of the present year. Pending this removal of the zoological collections, no material progress has been possible in extending the exhibition of antiquities. The new sculpture gallery erected from funds bequeathed by Mr. William White has been completed, and the friezes and other works from the tomb of Mausolus have been removed into it and partly re-arranged; many portions of the monument, hitherto placed out of sight in the basement, having been added to the exhibited remains. The arrangement of British and Anglo-Saxon antiquities in the rooms formerly occupied by botanical specimens has been carried out, and the rooms opened to visitors. The reading-room has been kept open until 8 p.m. by aid of the electric light, from the beginning of September to the end of April. A reference collection of illustrated works on architecture, art, and archæology has been formed, as auxiliary to the selection in the reading-room, and placed in the northern saloon of the library, near to the reading-room. The printing of the catalogue of accessions to the library has been continued. The addition to the museum building on the south-eastern corner, to be erected from the funds bequeathed by Mr. White, has been commenced, and the works are carried forward to nearly the full height of the outer walls. It is designed to give extension to the department of MSS. on the south side, including a room for the use of illuminated and rare MSS.; to provide accommodation for newspapers, with a reading-room in which they may be consulted; to receive the department of prints and drawings, with provision of studies and exhibition galleries; and to supply an additional gallery for the department of British and mediæval antiquities. The Museum publications have been given to free libraries of the United Kingdom. Reproductions of early Italian prints, and the series of volumes of descriptions of ancient marbles, have been presented to public art schools and museums; and electrotypes of ancient coins to the museums of Glasgow, Cork, and Nottingham.

During the year 28,722 volumes and pamphlets have been added to the library, of which 3,812 were presented, 9,297 were received under the English Copyright Acts, 508 under International Copyright Treaties, and 19,223 were acquired by purchase. Among the last are a considerable number of rare works, which were purchased at the sale of M. Firmin-Didot's library. Many of them are illustrated with fine engravings on wood, and are valuable as examples of the progress of that art. Amongst them are several books of Hours, including a very charming undescribed edition, printed by Le Royer, at Paris, about 1525, with beautiful woodcuts and borders. It is bound in Maioli style, with the owner's name, Marie Bechats, on the covers. Some Pageants, including "Les deux plus grandes et memorables rejoissances de la Ville de Lyon pour l'entrée de tres-grand Prince Henri III., Roy de France et de Navarre," Lyon, 1598. "Entrée de Loys XIII. dans sa ville d'Arles," Avignon, 1623; a very rare pageant, with full-page engravings. "Les Ordonnances royaux sur le fait

et jurisdiction de la prevoste des marchands et echevinage de la Ville de Paris," Paris, 1644; a presentation copy to Louis XIV., with a fine engraving representing the king as a child, attended by the queen mother, receiving the book from the provost and merchants. A charming edition of Æsop, with illustrations by Virgil Solis, Frankfurt, 1566. An edition of Seneca in French, printed at Paris for Verard, about 1491, with a woodcut representing the translator offering his book to the king, Charles VIII. A very fine copy, also printed by Verard, of the first French translation of Terence, with numerous woodcut illustrations.

At the different sales of portions of the Sunderland Library, which took place during 1882, 536 books were acquired for the Museum, including a considerable number of scarce editions of the Greek and Latin classics, as well as a number of works in the older literature of France, Spain, and Italy.

At the sales of the Beckford collection 123 lots were secured for the Museum library, some of them distinguished by the fine bindings for which that collection is remarkable. Amongst them may be mentioned: "La Vertu enseignée par les oiseaux," Liège, 1653, an interesting work, illustrated with curious copper-plates and bound by Roger Payne; a fine copy of a "Sluzhebnik," or Service Book, of the Russian Greek Church, printed by order of the Emperor Peter the Great, 1684; Luther (M.), "Passional Jhesu Christi," Nürnberg, 1552, with fine woodcuts by Virgil Solis; Meynier (H.), "Naissance et triomphes esmerveillables du Dieu Bacchus," a little book illustrated with charming engravings by an apparently unknown artist.

A large collection of Japanese books on pictorial art, brought together by Dr. Anderson to illustrate the collection of Japanese drawings which he had formed, has been recently purchased by the trustees. These works will form a valuable addition to the Japanese library, and, with those on the same subject in the Siebold collection, which is already in the Museum, will form a complete record of Japanese art.

Among the additions to the Manuscripts are a valuable text of the Gospels in Greek, with paintings of the Evangelists; a Breviary on vellum of the early fourteenth century in Latin, of German use, from Cologne, with well-executed miniature initials and borders; the note-books of the late Rev. R. W. Eyton, in twenty-four volumes, containing the results of his studies on the Domesday Survey and other early records; designs for historical medals commemorative of events in the latter part of the reign of Louis XIV., by Sebastien Leclerc, with notes and descriptions; an Ordinary and collections of foreign coats of arms, compiled by the late A. W. Morant, F.S.A., in nine volumes.

The Department of Prints and Drawings has acquired during the year 7,491 prints, drawings, and photographs, of which 5,069 examples were presented. The additions include an extremely valuable and beautiful collection of drawings, 165 in number, by Thomas Bewick, the celebrated draughtsman and wood-engraver, being the original designs for his works on "British Quadrupeds, Birds, and Fishes;" also a volume of proofs of his woodcuts, taken from the blocks by his own hands; and another volume containing drawings and prints by his brother and nephew. A collection of 1,321 proofs of plates engraved by John Pye, or under his direction, for the pocket-books, entitled "The Polite Repository," "The Royal Repository," and "The Souvenir"—the only complete set of these proofs in existence. Eight different donations by Mr. J. Deffett Francis, amounting in all to 1,440 prints and drawings, and including a highly-interesting collection of studies by Richard Cook, R.A., which give the artist's first ideas for nearly all his works. Among the drawings purchased are a study for the *Vision of St. Jerome*, in the National Gallery, by Parmigiano, studies by Masolino da Panicale, and Pietro di Pietro, two views of *London and Lambeth*, by Hollar, and a collection of upwards of five hundred original designs by John Doyle, for his well-known "H. B. Political Sketches."

The acquisitions by the Department of Oriental Antiquities from Babylonia and Assyria include three cylinders, duplicates, each filling out and completing the other, containing an account, by Nabonidus, king of Babylon, of the restorations of the temples of the country. The best of the three contains 159 lines of writing, divided into three columns. The inscription begins with the name, titles, and genealogy of Nabonidus. It then goes on to say that Ê-khulkhul, the temple of the Moongod at Harran, had been destroyed by the Sabmanda, or Medes, and the inscription here relates that the gods Merodach and Sin revealed to Nabonidus that it was the will of Bêl that the temple should be restored, the gods promising that the Sabmanda should be destroyed. This happened three years after, when Merodach "sent his young servant," Cyrus, king of Ansan, with his "little army," which overthrew the Sabmanda, and captured Astyages, their king. The restoration of the temple is next described, and the names of several kings, both Babylonian and Assyrian, given. Then follows the description of the restoration of the temple called Ê-bara, the shrine of the sun-god at Sippara. Nabonidus's first care was to find the records of former kings, and after some trouble, and the destruction of a large part of the foundations, he lighted upon the record of Naram-Sin, son of Sargon I. (known as Sargon of Agane, or Agade), whose date he gives as 3,200 years before his own time; that is, 3,700 years B.C. After this is given the description

of the restoration of the temple of the goddess Anunit, called Ê-ulbar, a very ancient building. The only record which Nabonidus speaks of having found in the foundation of Ê-ulbar is that of Sagasalti-Buriâs (or Saggasti-Buriâs), son of Kudurri-Bêl, a king who reigned about 1050 B.C. At the end of the record Nabonidus calls upon any prince who should come after him to restore the ruins of the temple, to read the record of his name, and not to alter it. He asks him also to cleanse the altar, to sacrifice a victim, and to place his own record with that of Nabonidus. If he do this, then Samas and Anunit will go by his side, will destroy his enemies, and will every day ask Sin, their father, for prosperity for him.

The following works, among others, have been purchased for the collection of Greek and Roman antiquities:—

Marble statue of an athlete about to throw a *diskos* held in his left hand; this statue, of which there are several replicas in other museums, has been thought, but without sufficient grounds, to be a copy of the *Diskobolos* of Naukydes, an ancient artist of the Argive school. It is more probable, however, that all these replicas are derived from some lost original of the best age of Athenian art. This statue was formerly in the Campana collection. Fictile *oinochos*, decorated with a design of red figures with gilt accessories on a black ground; a bearded figure in Asiatic costume, supposed to represent Midas, rides upon a dromedary, surrounded by a *thiasos* of male and female figures similarly dressed, who carry fans, torches, or musical instruments. The subject of this vase is most rare, and it is further remarkable for refinement of drawing and excellence of condition. It was formerly in the Beckford collection, afterwards in that of the Duke of Hamilton. A terra-cotta figure of Eros dancing, a *peplos* floating across his chest; the entire figure has been painted, the wings blue and gilt, the body red upon a white glaze; the modelling and general condition very fine; from Tanagra. Terra-cotta figure representing Ægipan seated cross-legged on a rock, at the foot of which are a ram and two goats, one of which he holds by the horns; on his right shoulder he holds a *lagobolon*, or shepherd's crook; from Tanagra. Two terra-cotta figures representing respectively an old man and old woman in grotesque attitudes; from Tanagra. A series of bronze cups, vases, and other objects, twenty-one in number, said to have been found at Galaxidi, near the ancient Delphi. These are remarkable for exquisite beauty of form and fine condition. A marble tortoise, and a marble shell of the form called *strombos*, with traces of purple and yellow colour. A collection of reliefs, heads, and other fragments of terra-cotta, part of a very large deposit of votive terra-cottas discovered by Professor F. Lenormant on the site of the Temple of Dionysos at Tarentum. The style of these terra-cottas varies considerably, ranging probably from the sixth to the third century B.C.; they are very interesting on account of the variety of types of divinities which they exhibit.

DUNFERMLINE FINE ART ASSOCIATION.

THE following letter has been addressed by the secretaries of the proposed Fine Art Association to the Town Clerk of Dunfermline:—

Dear Sir,—A pretty general opinion having been entertained for some time that an effort should be made to have an exhibition of paintings, &c., in Dunfermline, such as is now annually held in many of the principal towns, a number of gentlemen favourable to the scheme have had several meetings in connection with the formation of a Fine Art Association, and steps are about to be taken to bring the matter formally before the public; but we have, in the first place, been requested to ascertain if the Town Council would be willing to grant use of the large hall of the Carnegie Baths in which to hold an exhibition, as it appears to be the most suitable place for the purpose. It is proposed to hold the exhibition in the end of the year; and as the swimming bath is closed during the winter months, we are in hopes that the Town Council may see their way to accommodate the association. A temporary flooring would require to be laid, the present trapeze erection removed for the time, and one or two trifling alterations effected so as to make the place suitable. This would all be done, of course, at the expense of the association, and the hall afterwards restored to its original shape, also at their expense, and to the satisfaction of the Town Council. It would be very desirable at the same time to have the use of any of the other rooms that could be given without inconvenience to the public. The accommodation might be required for about six weeks. We venture to express the hope that the Town Council will approve generally of the scheme, as one likely to be of some benefit to the community; and that if they agree to grant the use of the building, they will give it without charge, or at all events at a nominal rent, seeing that an exhibition of the kind proposed will be attended with considerable expense, and will certainly be no source of profit to the promoters. Please lay this application before the first meeting of the Council, and oblige, yours faithfully,

(Signed)

JOHN SMITH, } Joint Secs.
GEORGE REID, }

The application has been referred to the Baths Committee for inquiry.

NOTES AND COMMENTS.

AN attractive programme has been prepared for the annual meeting of the London and Middlesex Archæological Society, which will be held on Wednesday next. The members will meet at St. Vedast's Church, Foster Lane, when a paper on the building will be read. Afterwards they will visit Goldsmith's Hall, a building which is rarely opened to strangers. The famous plate of the company will be exhibited. It includes a salt and cover, 22 inches high, presented by RICHARD ROGERS, Comptroller of the Mint in 1632; a salver, silver gilt, weighing 383 ounces; a great cup and ewer, which are the work of PAUL LAMERIE, a goldsmith who was competent to work with his own hands; a standing cup, made in Augsburg in 1596; and a salt, which is in form of an Ionic temple. The plate will be described by Mr. WILFRED CRIPPS, who has made the subject his own. Some antiquities found in the neighbourhood will be exhibited as well as prints and drawings illustrative of the hall, St. Martin's-le-Grand, and the vicinity.

PROFESSOR BLACKIE has been hitherto recognised as one of the Scottish champions who was always willing to strike vigorously in behalf of everything that is national. But he is a student of PLATO, and therefore of æsthetics. Having unfortunately a theory of the beautiful of his own, which is not adapted for the use of artists, he is forced to declare that his countrymen, who will not make him art dictator, are of all modern people "perhaps the most unæsthetic." This defect, he maintains, is to be especially seen in their architecture. "In one department—architecture—in which notable improvement has recently been made, the Scotch," says the Professor, "stood below even the lowest standard that ever prevailed in England. The beauty of church architecture in England, even during the supremacy of pseudo-classicality, kept alive amongst the people a genuine native taste for the graces of stone-work; but in Scotland ecclesiastical architecture existed only in a few elegant minds, used as an occasional stimulant to a sentimental verse, but not as a living fount of healthy action." Some of the Scottish abbeys may have been designed by English monks, but there is enough of mediæval architecture remaining in Scotland which is not English to prove that Professor BLACKIE has gone too far in the condemnation of his countrymen. But whatever was the state of architecture in the past, no English architect would agree with the Professor in his belief that the modern standard in Scotland is below the English. If Professor BLACKIE will compare the two commercial capitals, Glasgow and Liverpool, he need not feel ashamed of Scottish designers. He is of opinion that to the Scotch Calvinist art is no divinity, but, however true that may be, Calvinistic architects have somehow shown that the divinity is not too strait-laced in doctrinal matters, and has very often inspired them with ideas not unlike those with which she filled the brains of her pagan worshippers.

A DECISION given last week in the Irish Court of Appeal extends the liability of engineers, and therefore of architects. They will henceforth run the risk of being made responsible in actions for trespass. A contractor, who was employed by a Drainage Board, entered on lands which had not been formally purchased. An action for damages was brought by the owner, but he passed over the Drainage Board and the contractor, and made the engineer of the Board the defendant. At the trial the jury gave a verdict for the plaintiff. The verdict was, however, set aside in the Queen's Bench Division, on the ground that the defendant, being merely the superintendent of the works, was not responsible. The plaintiff appealed, and a court, composed of the Lord Chancellor, the Lord Chief Baron, and a Lord Justice, affirmed the verdict of the jury, on the ground that all parties accessory to the commission of a tort are responsible therefore in damages.

It was, we suppose, inevitable that the calamity at Sunderland should be made a text in order to descant upon the defects of architects' designs in this country. In a thousand English buildings; according to the *Times*, people are running similar risks from structural defects of the most glaring and fatal kind, or when there is an "exceptional architect" from the frustration of his devices. At Sunderland the responsibility for the calamity does not lie with the architect. The building was designed as a temperance hall about fifteen years

ago, and was examined by public officials, and certified as a safe place for public meetings and the like. Ample space on stairs and passages was allowed for the egress of visitors. Since the building was taken over from the original proprietors, a strong door was constructed across the first landing from the street. Barriers of the kind are often useful in preventing overcrowding, and this door swung freely on the hinges outwards and inwards. In this case there was a bolt, which, when fastened, narrowed the opening to about eighteen inches, in order that the visitors might pass the pay place one by one. The admission to the fatal entertainment was a penny, and at such a rate check-takers could hardly be afforded. When the children had all entered, by some oversight the bolt was not removed, and in their eagerness to reach the body of the hall from the gallery the narrow opening was blocked—with what disastrous consequences is too well known. But the result is to be attributed to defective organisation instead of to defective planning. Young and old in England are supposed to be able to take care of their own safety, and so long as the managers of theatres and public halls are permitted to leave the passages and stairs without some person to keep the way clear, accidents will occur. It is, for example, not uncommon for the gas to be extinguished on the stairs of a gallery, and great danger is thus incurred.

THE failure of the auction of the Strawberry Hill estate suggests that historic associations do not count for much at the Mart. The property contains over thirty-three acres, which should be valuable from the position. As it has a frontage of about 5,000 feet, a sum of 25,000*l.* is not too high a value for the land. HORACE WALPOLE expended over 50,000*l.* upon the house. It is true a great deal of the money was misspent by him on gimcrackery details, but this could not be said of the outlay of the late Countess of WALDEGRAVE, which is estimated at from 60,000*l.* to 100,000*l.* The highest bid for an estate that had so many attractions was, however, only 25,000*l.*, and the property was withdrawn. If Strawberry Hill were less famous probably the bids would have been more liberal. In historic buildings *nouveaux richesses* are compelled to abate some of their arrogance.

MR. F. C. PENROSE has explained the present position of the St. Paul's Improvement Scheme. For about four years, he says, the executive committee were engaged on the general scheme for the embellishment of the interior of the cathedral, proposing at first to begin with the choir. Numerous meetings were held, involving lively discussions, as will be remembered by all who have taken an interest in the matter; but elaborate designs were also prepared, both on paper and in model, which are still extant, to show that much was done in this direction. However, in 1877, the committee concluded that it would be best to commence with the decoration of the dome, and, having settled on the general features of the design, they engaged the services of Sir FREDERICK LEIGHTON and Mr. POYNTER to prepare full-sized cartoons, which, when completed, were to be put up in the position which the permanent mosaic paintings are to occupy. These artists undertook to have the cartoons ready by the early spring of last year. They were not then ready, but the artists assure the committee that they are far advanced towards completion, and it can now be definitely stated that there is every reason to expect they will be ready for exhibition in the place for which they are designed in the autumn. When it is stated that the cartoons referred to will cover a space of about four thousand feet superficial (this, however, includes an alternative version of the same general design, which has been entrusted to Mr. H. STANNUS), it will be evident that, if they are approved, the committee will have made a great step forward.

THE First Civil Chamber of the Tribunal of the Seine has given judgment in the claim of the gas company against M. PERIGNON, who sought to show that he was immediately entitled to the benefit of the reduction from 30 c. to 25 c. per cubic mètre in the price of the gas supplied to him, under the terms of the decree of the Prefect of the Seine enjoining the plaintiffs to effect such reduction. The decision of the Court appears to meet the justice of the case very well, M. PERIGNON being required to pay the balance of 5 c. per mètre in dispute into the Caisse des Dépôts et Consignations pending the decision of the Conseil de Préfecture as to the validity of the decree.

MESSRS. WOODHEAD & CLARKE'S NEW PREMISES, SHOREDITCH, E.

THESE extensive premises have recently been built in High Street, Shoreditch, at the corner of Bethnal Green Road, for Messrs. WOODHEAD & CLARKE, of 187 High Street, Shoreditch, and Liverpool Street, City, tobacco-manufacturers and cigar importers, to meet the requirements of their rapidly-increasing business. The frontage is 170 feet, and the superficial area upwards of 4,000 feet. The shop frontage towards Shoreditch is devoted to the retail trade, the wholesale department being situate near the corner in Bethnal Green Road. The remainder of the space on ground floor and the upper floors is used for manufacturing purposes. The basement and vaults, all of which are well lighted by HYATT'S lens lights, are used for storage, &c. The boiler occupies a space at one end of basement, and the engine, cutting machines, and manufacturing appliances are fitted up on ground and first floors. The cornices and window dressings, &c., to fronts of the premises were supplied by Messrs. LASCELLES & Co., in their concrete of buff colour. This firm also executed the shop fronts and internal fittings. The general contract was undertaken by Messrs. W. & F. CROAKER, of Great Dover Street, Borough, S.E., the architect being Mr. J. W. BROOKER, of 13 Railway Approach, London Bridge, S.E.

BROCKHAM PARK, SURREY.

THE RESIDENCE OF LIEUT.-COL. SEYMOUR.

WE publish this week views of this country-house before and after the alterations just completed. Both views are taken from precisely the same point on the north-west side, and it may be interesting to note how easily a house can be entirely altered in character.

The plan and general arrangements of the house, as now completed, are entirely owing to the most precise and detailed directions of the owners, who may be said to have been their own architects, leaving only to the professional men employed the translation of their clients' ideas into architectural form. The principal entrance was formerly on the west side of the building, and as the carriage drive to it followed a winding road to the north, no part of the gardens remained private. The north was the approach, the west the main entrance, the east the tradesmen's and servants' entrance, and the south was overlooked both by the east and west approaches. To remedy this defect the principal entrance had to be made on the north side, turning the space formerly occupied by a staircase into the entrance-hall, and the roads and gardens were relaid by Mr. MILNER, the well-known landscape gardener, so as to screen from the carriage-drive the grounds to the south and west of the house. An additional floor of bedrooms was also required. This was obtained by taking down the balustrade and putting on a mansard roof, with a line flat over the whole surface of the building. The architects considered that the style most in keeping with the parts of the existing building, and with the necessity of having a mansard roof, was the French Château Renaissance; and to get the details as much as possible in keeping with this style, they had their line ornamental work, finials, cresting rolls, gutters, &c., made in Paris, by the well-known firm of MM. GRADOS, Boulevard Richard Lenoir. The general contractor for the works was Mr. WM. BRASS, of Old Street, City. Mr. GILBERT BURTON acted as clerk of works, and Mr. JAMES PEARCE as foreman. The whole of the works were carried out from the drawings and under the superintendence of the architects, Messrs. HARVEY & PROTHOROE, 10 Great Queen Street, Westminster.

DESIGN FOR CHURCH OF ALL SAINTS, IPSWICH.

THE design we illustrate to-day was submitted in the competition for the above church a short time ago. The author, Mr. WALTER MILLARD, of 19 Great George Street, Westminster, says in his report:—

"In making this design I have kept mainly in view the object of accommodating, at the lowest reasonable cost, a congregation of 800, in such a way that as many as possible shall be able to see and hear the services conveniently. Taking the word 'Space,' therefore, as my motto, I have contrived a wide nave (30 feet span), opening into a spacious central area unencumbered by columns, and beyond these a moderately-sized chancel for the clergy and choir. I find that in my design not more than a dozen of the congregation, out of the total number

of 800, will be actually shut out by columns from seeing the preacher in the pulpit, the nave aisles serving as passages only.

"The chancel being of the same width between the walls as the nave, allows of triple division by screens into a middle span (of 22 feet) and side aisles, which latter would afford most convenient side exits for communicants. The row of chairs in each of these aisles outside the screens might well serve for some sort of auxiliary choir of amateurs—ladies, perhaps—who by their position could render most efficient and suitable support to the regular choristers, at the same time without appearing too prominently before the congregation. There are four public entrances to the church, placed conveniently for easy exit, one at each corner, as it were, of the congregation.

"In designing the elevations I have proposed to use local brick as the most economical material for sound walling, and pointed arches as the strongest and most convenient form of construction over openings.

"In order to save unnecessary expense no carving or tracery is introduced; all jambs and arches are shown to be executed in plain chamfered bricks, and a very small quantity of stone need be used.

"In the construction of the nave roof, I would avail myself of light wrought-iron tie-rods, thereby securing the requisite safety and strength in the most economical manner.

"Having reduced the large central area to the form of an irregular octagon by arches across the corners, I propose to ceil it with a twelve-sided dome, resting on vaulting which springs from the angle of the octagon. The visible portion of this would be all executed in wood; but, in the actual construction of the octagonal roof, I would employ iron to a great extent, thus insuring a cheaper, tighter, and stronger framework than could be got by the use of timber alone. At 6d. per cubic foot the church would cost about 7,600l., exclusive of the tower and spire.

"Though departing somewhat from the orthodox type of church plan, I trust that I have shown how considerably greater convenience for public worship may be obtained than by the regulation nave and aisles plan, without any sacrifice of the dignified architectural treatment required in such a building, and yet without converting the church into a mere lecture hall. In fact, I can imagine no feature more calculated to give dignity, and even impressiveness, to an interior than a dome."

THE HELLENIC SOCIETY.

THE annual meeting of the Hellenic Society was held at No. 22 Albemarle Street on the 14th inst., Professor C. T. Newton, C.B., vice-president, in the chair. The annual report of the council was read and adopted. The balance-sheet showed a working balance of about 650l., but it was pointed out that this did not leave much surplus, after the publication of the journal and the payment of current expenses, to devote to other objects contemplated by the society's constitution. The number of members and subscribers now amounted to 568, which was satisfactory in so short a period as four years; but if the number were raised, as it easily might be, to 1,000, the society would be in a position to do far more useful work. The council called the special attention of members to the project for establishing a British school of archaeological and classical study at Athens. On this subject, after some preliminary remarks from the chairman, Professor Jebb made a statement to the meeting of the position and prospects of the scheme, which he had introduced to the public in a recent article in the *Fortnightly Review*. The editor of that magazine, Mr. T. H. S. Escott, had taken up the idea warmly, and through his help adherents of the highest eminence had been gained for the project. The Prince of Wales and the Duke of Albany had promised support, and so had the Chancellors of the two Universities, the President of the Royal Academy, the President of the Society of Antiquaries, the Bishop of Durham, and others. A circular would shortly be issued defining the lines on which the scheme would be based, and inviting not pecuniary aid but adhesion. After this had had time to take effect a meeting would be held in London, probably in July, which would be made as representative as possible. At this meeting a general committee would be appointed, and also an executive committee, which would be charged with the duty of drawing up a scheme in detail. On this committee it was proposed that the Hellenic Society, the Dilettanti Society, the Society of Antiquaries, the Universities of Oxford and Cambridge, and other important bodies should be represented by delegates. The following would be main features in the scheme: (1) The school would be not exclusively of archaeological science, but more widely of Greek studies in Greek lands. Professor Jebb's own views upon this point had been emphatically confirmed by Mr.

W. M. Ramsay and Professor W. W. Goodwin; (2) there must be a director with a salary of not less than 500*l.*; (3) a library, of which the director would take charge, and a house—it had been estimated that a good house could be built for 3,000*l.*—a site on Mount Lycabettus would probably be granted by the Greek Government; (4) membership would be open to all persons accredited by the Universities or other responsible bodies, and, possibly, on payment of a small fee, to travellers residing in Athens only for a few weeks; (5) it was proposed that the director should give guidance and advice to students and possibly encourage the occasional reading of papers, but it was desirable to leave him as free as possible. In conclusion, Professor Jebb stated that he had received a letter warmly approving the scheme from Mr. Gladstone, with a promise to contribute 50*l.* He thought that on the whole there was a decidedly hopeful prospect of raising the 20,000*l.* considered necessary to establish the school. After the council and officers had been elected—the Rev. Dr. H. A. Holden, Mr. J. R. Thursfield, and Mr. J. E. C. Welldon being added to the council—a vote of thanks to the chairman was moved by the Warden of Keble College, who paid an eloquent tribute to Professor Newton's eminent services to the cause of classical study in England. The vote was seconded by Professor Mahaffy, and carried unanimously. In returning thanks, Professor Newton expressed particular regret at the absence of the president of the Society, the Bishop of Durham, on the present occasion, because he was known to take a warm interest in the school of Athens scheme, and the advice of so eminent a scholar and so weighty a counsellor would have been of the greatest value. The chairman confirmed the views expressed in the council's report, by a special appeal to members to do more than had been done hitherto in the way of proselytising. Very little persuasion, he said, was needed to induce those interested in Greek studies to join the Society, and if only 1,000 members could be secured, he was convinced that the Society could carry out work of the utmost importance to science and to scholarship.

MANTEGNA'S "SAMSON AND DELILAH."

THE public will have heard with much gratification, says the *Times*, that the remarkable work by Mantegna, which has excited so much attention during the past few days, has been added to the national collection. It would have been nothing short of disastrous if it had been allowed to leave the country, and it is to be hoped that the authorities are awakening to the sense that men of all parties and in all positions are agreed that henceforth a wise liberality must be exercised in the direction of making our gallery worthy of the nation. And in this endeavour they may fairly claim the assistance of owners of valuable pictures, who for any reasons are obliged to part with them. It is scarcely patriotic to effect a secret sale to a foreign museum of objects that the nation would willingly purchase at a fair price; rather might it be expected that, as in recent instances in a neighbouring country, individuals would forego some chances of extra gain for the honour of increasing the splendour, and also the usefulness, of our national art collections.

The work mentioned above was one of the Sunderland collection of drawings. It is really a tempera painting in *grisaille* on fine linen, the subject being *Delilah Cutting off the Hair of Samson*. The treatment is entirely in the spirit of an antique bas-relief: this form of presentation is consistently carried out, even to the last shadows thrown by the figures and inanimate objects on to the plain unoccupied surface, which is painted to represent red marble. The black streaks, intended to indicate marbling, are put on in such rough fashion, so unlike the rest of the work, as to suggest the addition of a later hand. Delilah is shown seated on the ground and supporting in her lap the prostrate form of Samson. She holds his head between her knees while she shears off his flowing locks. Apart from the fact that her attention is directed to the mechanical operation, her expression is that of absolute and entire unconcern. Look of cunning, or of deceit, or of triumph there is none. Mantegna was not the man to shirk expression when he deemed the subject required it; he could even, as in his engraving of the *Entombment*, push it to the utmost verge of unrestrained passion. Therefore we must conclude he has left the features impassive in obedience to the formula of a certain school of antique sculpture. He has, however, scarcely adhered to his self-imposed rule in delineating the countenance of Samson, whose head has fallen forward in heavy slumber; the parted lips and muscular action almost suggesting that his breathing is stertorous. In drawing the features Mantegna has evidently stuck close to his model, whose type was certainly not heroic. The old Adam of mediæval earnestness, together with the native Italian inclination towards realism, have been, in this instance, too strong for the dawning Renaissance devotion to classical forms. He returned to his allegiance in the arrangement of the draperies, which are cast on the lines of the antique bas-reliefs of the Greco-Roman manner rather than pure Greek. Samson has the short tunic leaving the legs bare, and Delilah wears the *tunica interior*; thin in texture, it clings to her form, while the arms and bosom remain nearly un-

covered. The folds, however, have not the easy flow of the antique models; yet the slight rigidity and timidity of execution give a pungency which is often wanting in the maturer work of the facile Greek artists. It is precisely this bitter flavour, this severity of treatment in dealing with material whose only intention is beauty, and also in association with ideas that are purely spontaneous, wherein consists one of the principal charms of the art of Mantegna.

The figures are placed beside a fountain, whose thin stream of water drops into a marble tank shaped like an antique sarcophagus. Lilies flourish in the moist earth at its base, and behind rises up the trunk of an olive tree, which gives support to a vine, whose foliage and bunches of grapes hang in festoons at the top of the composition. This detail of the vine and olive tree recalls a passage in the master's picture of the *Agony in the Garden*, at Tours. In both cases the leaves, the clusters of fruit, and the serpentine stems are drawn with the same accuracy and delight in working out those accidental combinations of elegant forms which make the vine such an ornamental accessory in painting and sculpture. The fragmentary passages of Mantegna's biography that have come down to us clearly reveal that he never hesitated to call a spade a spade. Here he has carved on the trunk of the olive tree—*FOEMINA DIABOLO TRIBUS ASSIBUS EST MALA PEIOR* (the TR in TRIBUS being united).

It scarcely needs, however, the confirmation of minor passages to prove the authenticity of the *Samson and Delilah*. The masterly drawing and modelling of the figures, the just foreshortening and the breadth of style, are entirely in the manner of Mantegna, and of Mantegna in the plenitude of his power. The extant work by him to which this picture bears the closest relation is the *Judgment of Solomon*, in the Louvre. The fact of their both being the same size and painted in *grisaille* on linen, their Scriptural subjects and similarity in the treatment of the figures, tend almost conclusively to prove that they are either a pair or both a portion of a series. They belong to the class of elaborate designs in monochrome so much sought after during the life of the painter, and to multiply which he applied himself to the practice of engraving. Neither of them reaches the marvellous beauty and refinement of execution displayed in the *Judith with the Head of Holofernes* of the Uffizi Gallery, which was formerly in the possession of Vasari. He concludes an enthusiastic description of its merits by saying that in a sense it may rather be called a painting than a drawing. So also with the *Samson and Delilah*, whose artistic value must not be measured by its size. Mantegna's frescoes and larger pictures are faithfully worked out, even to the representation of the passing cloud, and the weed by the wayside. It is sufficient to mention the strength of dramatic action that characterises his majestic decorative compositions. But when he restricted himself to the dimensions of those small panels or pieces of linen or paper, so well known to students of art, his ideas seemed to gain in intensity. A keener perception of the beauty of nature and of the more hidden springs of emotion was developed, and along with the increasing refinement of execution the imagination became more sensitive and piercing. At Florence and Venice, at the Belvedere and the Louvre, those who are not carried away by size and show turn again and again to the cabinet masterpieces of the head of the Paduan School. The same enjoyment now awaits the visitor to our own National Gallery.

USE OF THE THERMOMETER IN HOUSES.

SOME interesting remarks have been lately published by M. Gaston Tissandier on the difficulties presented by thermometrical observations of the temperature in rooms, no part of which is the same, especially when a fire is burning. Desiring to ascertain the extent of these differences of temperature in the same room, he had a good fire made in his study, and measured the temperature at various points by means of an accurate thermometer constructed by M. Tonnelot. He allowed the thermometer to remain for more than ten minutes at each point, and only registered the degree after two successful readings, taken two minutes apart, gave the same indication. M. Tissandier took, for his observations, three different heights, which, with the temperatures, we have converted into English measurements, viz.: 4 inches from the floor, 5 feet above the floor, and 8 inches below the ceiling. Placing the thermometer in the middle of the room, and 6 feet 6 inches from the fireplace, the temperatures were, for the same vertical line, 67 deg. Fahr. near the floor, 69 deg. midway, and 70 deg. near the ceiling. Observations made out of the fire's influence, and 3 feet from a wall, above 65 deg. near the floor, 66½ deg. in the middle, and under 70 deg. near the ceiling. At a distance of 3 feet from the window, the joints of which were very defective, the thermometer registered 64 deg. near the floor, and 65½ deg. near the ceiling; while, just near the joints of the window, the following readings were taken: 61 deg. at the bottom, 62 deg. in the middle, and 64½ deg. at the top. The temperature over the mantelpiece was 71 deg.: in fact the temperature of the room varied from 61 deg. to 71 deg., that is to say, between 10 deg. of

Fahrenheit's scale. M. Tissandier also found a difference of $1\frac{1}{4}$ deg. Centigrade, or $2\frac{1}{4}$ Fahr., on comparing four high-priced thermometers; and it is probable that cheap instruments would show greater variation. To arrive at the mean temperature of a room with sufficient correctness, M. Tissandier advises that a strong thermometer, obtained from a good maker, be swung round and round by the wrist for about two minutes in; two or three different parts of the room, and that the average of the readings be taken, at the same time observing the precaution of making sure that two successive readings correspond. An approximate idea may, however, be obtained by placing the thermometer on a piece of furniture, so that it be out of the influence of the fire and of the windows.

LEEDS PUBLIC LIBRARY.

THE Leeds Municipal Offices are now approaching completion, and the *Leeds Mercury* says the attention of the Corporate Property Committee is at present directed to the furnishing of the various departments. At the last meeting of the Town Council it was agreed to expend about 6,100*l.* in furnishing the Public Library and General Pay Offices, the plans for which had been prepared by Mr. George Corson, the architect of the building. The furnishing, which has just been let by contract, comprises the general reading-room, the lending library, and the reference library, the general pay office, and the office for the clerks connected with the gas and water departments. The general reading-room in connection with the Public Library is situated upon the ground floor. It is about 80 feet long by 40 feet wide, and is arranged as a nave 21 feet by 40 feet, with aisles separated from it by an arcade of granite pillars having stone arches. The fittings of this room, which will all be in American walnut, comprise large tables placed in the nave for readers, and sloping stands within the aisles for newspapers. The lending library occupies the floor immediately over the general reading-room. It is the same size as the latter, and the nave and aisles have been similarly treated, but the arcade is formed with terra-cotta arches in place of granite and stone. The space devoted to the public for the issuing of books consists of the main portion of the nave, extending to 66 feet in length by 15 feet in width, this space being defined in the nave by a continuous counter. The counter front will be formed of American walnut, mahogany, and pitch pine framed into bays, marked by detached shafts of greenheart and mahogany, having carved capitals of lime tree carrying the overhanging top, the front of which will have an inlaid band of various coloured woods. The space within this counter will be utilised for the reception of books returned during the day. The indicators will be placed upon the counters, opposite to the piers of the arcades, with open counter spaces between them, receiving the full light from the window. There will be nine such spaces between the indicators, each 8 feet long, on the sides; and one space, 15 feet long, at the end; the aggregate available space for the issuing of books to the public being 60 feet. The aisles will be devoted to the storage of books. The bookcases will stand across the aisles, forming them into small bays, with the books face to face, and leaving, for future extension, accommodation for at least twice the number of books that the library at present contains. All the bookcases will be made of American walnut, with movable shelves, and will be fitted with blinds on spring rollers. At the end of the lending library there is a room 32 feet square, and this the Library Committee have decided, for the present at least, to arrange as a museum, and here Mr. John Holmes's antiquarian collection will be exhibited. The reference library is on the floor above the lending library and museum. It occupies two storeys, there being the main floor area and a spacious gallery extending on all sides. The structural arrangement of the room is similar to the lending library. In the nave there will be large tables for general readers, and in the aisles and also in the gallery there will be tables of the same description for the use of students. Who is to take the responsibility of admitting students to these reserved portions of the library—whether the librarian and his assistants or the committee—is a point which, we understand, has not yet been decided. At present, any person who fills up the necessary form of application can obtain a book for perusal among the general readers in the reference library, but it is obvious that it will be impossible to grant the request of every stranger who may call and ask to be admitted to the inner tables. The history of public libraries shows, unfortunately, that the theft and mutilation of books is not uncommon; and while persons engaged in literary work may be glad of an opportunity to pursue their studies apart, the privilege will have to be very much restricted. The counter for the attendants will be 25 feet long, and a book-hoist communicates with the gallery, so that books may be readily removed. On this floor there is a committee-room, a librarian's room, and rooms which it was originally intended should be occupied by book-binders; but this idea has been abandoned, and the latter will probably be utilised for specifications of patents, Parliamentary papers, and newspapers. The bookcases and counters in the reference library will be of American walnut, with a slight use of

St. Domingo mahogany and richly-figured pitch pine. At the extreme end of the room, on both floors, the most valuable books will be arranged in handsome cases enclosed with plate-glass doors.

The general pay-office is a large room upon the ground floor, facing the principal entrance from Calverley Street. It is 78 feet long by 30 feet wide. The counter for the receipt of all monies paid for water rents, gas bills, rates, and drainage accounts will extend the full length of the office, leaving a space 9 feet wide for the use of the public. Within the counter the remaining space will be utilised for the use of the clerks connected with the rates, gas, and water departments. The desks will be 12 feet long, with double slopes, and will extend at right angles to the windows. The rates department will be located at the right-hand end of the room, the water department will occupy the centre, and the gas department the left. A room adjoining, 61 feet long by 30 feet wide, will be used for the general work of the gas and water departments. It will be provided with five double desks each 20 feet long, standing at right angles to the windows. The general pay-counter will be composed of walnut, mahogany, and richly-figured pitch pine, formed into bays having detached shafts of walnut, St. Domingo mahogany, and greenheart. The counter top will be framed of Tobasco mahogany, and will have rosewood edges. The inside of the counter will be completed with till-drawers and cupboards. The contracts for the work have been let to the following Leeds firms: Messrs. Marsh, Jones & Cribb, Messrs. Roodhouse & Sons, and Messrs. Pearson Bros.

It is intended to light the above rooms with the electric light. In the public library incandescent lamps will be employed, and arc lamps will be used in the general pay offices, and the gas and water offices. Mr. Corson is now preparing the plans for furnishing the borough accountant's and borough engineer's departments and the museum, together with the smaller offices, and it is expected that estimates for carrying out this work will be received in a short time.

CHURCH-BUILDING IN BARNSTAPLE.

THE Archdeacon of Barnstaple last week held a visitation of his district. In the course of his charge he gave the following account of the progress of church-building in Barnstaple and Sherwell:—

There is, however, one great cause for satisfaction in reference to what I have just said, and that is that in many parts of the Archdeaconry, as well as elsewhere, very little need be said in the churchwardens' returns on the condition of a large number of our churches in consequence of their thorough restoration, showing that we in this diocese and in this archdeaconry have not been backward in that vast and wonderful effort which has characterised the last forty years and more of our ecclesiastical history, and of our ancient churches and cathedrals, restored. The total cost of this work in the diocese of Exeter, as given in Lord Hampton's returns for the thirty-four years from 1840 to 1874, is the large sum of 782,305*l.*, expended on the building and restoration of 400 churches and one cathedral. It must be remembered also that the churches restored at a cost of 500*l.* are not included in this summary, so that a considerable amount of money should be added to the above 782,305*l.* to represent the actual outlay on this great work. And the same work has been rapidly going on ever since the year 1874, so that we have to add to the above large expenditure an approximate sum as spent during the last nine years, but the amount, of course, I am unable to state. And all this has been done entirely by the voluntary contributions of churchmen wholly unaided by the State.

From the consideration of such remarkable liberality in church building and extension, we descend to a very small portion of it as exhibited in our own archdeaconry. Yet I am sure that my rev. brethren, and also the churchwardens, can testify that we have been and are by no means backward or careless as to the churches of the archdeaconry. Several blots, of course, we know still exist, unwiped out as yet from various reasons, most of them in consequence of scanty means. There is the will, but not the means. You will remember that two years ago I put before you a summary of what had been done in this respect up to the year 1880. The statistics then submitted showed that of the 152 churches and chapels-of-ease in the archdeaconry, 53 had been wholly restored, 37 partially, 19 rebuilt, and 8 new churches, giving a total of 117 of the churches and chapels in the archdeaconry thus dealt with and restored. The cost of these works was returned at the sum of 190,155*l.* In the present year we can show still further progress in this good work. Thus in the deanery of Southmolton the dean-rural reports that the church of Nymet St. George has been admirably restored, and is now remarkable for the beauty and abundance of the wood-carving. The restoration of Witheridge Church, in the same deanery, has been recommended by the vicar, I believe at his own cost. Preparations have also been commenced for the most needful work of the restoration of the church of Roseash. As regards the deanery of Torrington, I regret that I made no reference at my last visitation to what had been done in the church of Alverdiscott. The chancel has been under restora-

tion this year (I believe at the sole cost of the rector), and the church is now reported as being perfectly and substantially restored. The churchyard in the parish of Roborough, in the same deanery, is beautifully laid out at the cost of one of the churchwardens. It is quite a pattern, and well worth a visit. I could wish that some steps could be taken in many other churchyards in the archdeaconry to get rid of their untidy condition. In one especially the fences are so dilapidated that there is no protection to prevent cattle straying into the churchyard. It is certainly painful to see "God's acre" so neglected as it is in some parishes in the archdeaconry. In the deanery of Barnstaple the old and ugly church of Newport is being replaced by another, now in course of building. It is externally completed, but the internal arrangements are still in the architect's hands. The new church will probably be consecrated in the course of the summer or autumn. The ancient parish church of Barnstaple has now undergone a complete restoration. The ugly and cumbrous gallery, which had become for some time disused, has been entirely removed, and the church is now what it should be—beautiful and thoroughly fitted for the celebration of Divine offices. The church of Atherington, in the same deanery, is in the hands of Mr. Pearson, the eminent architect. The restoration is rapidly moving towards completion, and will be most likely re-opened in the course of the summer or autumn; and I can well believe that it will be one of the handsomest in the deanery. The dean-rural of Sherwell states that almost all the churches in that deanery may be reported as in good or in excellent repair. The church of Countisbury is, indeed, one of those which most urgently requires restoration. The restoration of the church of Stoke Rivers has been commenced. The first step in its restoration is that of the tower, which has been for several years in a most dangerous condition. It is being admirably restored in a solid and substantial manner, and new large and handsome windows are being placed in it, and will be a great ornament to the tower. The excellent restoration and enlargement of the church of Holsworthy is still in progress. The substantial part of the chancel walls and roofs was completed last year, and the oak stalls and internal decorations will be put in in due course. And it is a matter of very much satisfaction to be informed that the lay impropiator has undertaken to restore the chancel of Bradworthy Church at his own cost. The church of East Putford has been perfectly restored, and the tower of West Putford is being rebuilt. I think it well that I should enter into these particulars as proofs of progress in church-restoration in the archdeaconry, and as a matter of self-congratulation to the clergy, and also, I feel sure, to the churchwardens of the several parishes.

THE VICTORIA HALL, SUNDERLAND.

THE following description of the Victoria Hall, Sunderland, the scene of the disaster on Saturday last, has appeared in the *Newcastle Chronicle* :—

The building is of Gothic architecture, and stands in an excellent position at the southern side of Sunderland, and in close contiguity to the public park. The main front faces Toward Road, and the principal entrance is at the southern end of the building, which is erected close up to the dwelling-houses in that thoroughfare. The northern end of the hall adjoins a blank space of ground, which is held in reserve for building purposes, and the bare gable points in the direction of the Borough Road. The eastern side of the hall fronts Tavistock Place, and at its southern extremity is the entrance to the gallery, within a short distance of which the lamentable mishap occurred. The building was erected about fifteen years ago, from the designs of Mr. G. Gordon Hoskins, architect, of Darlington. It was built at the cost of a body of gentlemen interested in the temperance cause, and the chairman of the combination was Councillor Robert Swan. It was intended to use the building as much as possible for the furtherance of the cause of temperance, and care was taken to secure as large and spacious a public hall as could possibly be put within the limits of the site. Briefly speaking, the enterprise was not a success, and the building came into the market some ten or eleven years after the date of its erection. A proposition was made to purchase the building to serve the purposes of a town hall for Sunderland, the intention being to include in the premises a new erection upon the vacant ground adjoining. A Government inquiry was held in the town with reference to this project, but the result of the negotiations was a failure to purchase the building and the site, and finally the hall was sold to the Messrs. Backhouse, bankers, for 6,500*l*. To this firm the building belongs at the present time, and we have no doubt that the lamentable occurrence will be the cause of the utmost regret to all the members of the well-known family. We may here state that the building has been examined by the Government officials and duly certified as in a safe and proper condition for the purpose of public meetings and entertainments, for which it has been principally used. A glance at the arrangements of the interior is all that our space permits at the present moment. The auditorium is of exceedingly noble proportions, and is divided into three portions. The upper gallery is calculated to

seat 1,100 adults, but when packed full it has held as many as 1,500 persons. The dress circle, which is beautifully upholstered and decorated, is calculated to hold between 800 and 900 persons; and the lower portion of the auditorium, known as "the body of the hall," has seats for 1,000 visitors. The ordinary sitting capacity of the building will thus be about 3,000, but upon some occasions quite 500 more have been crowded into it. A small stage or platform faces the auditorium at the eastern end of the building, and it is reached by entrances from the corridors which run round it on each side. As we have stated, the main entrance is in Toward Road, and it is reached by a flight of steps which conducts into a spacious lobby. The body of the hall opens directly into this space, and a staircase leads to the dress circle. The gallery can be reached from this main lobby by two ways, viz., through the dress circle, at the back of which there is a large lobby, in which a door gives access to the gallery stairs; and through the main lobby, by descending a flight of stairs which join the main gallery entrance almost at its lowest point. The ordinary entrance to the gallery is from Tavistock Place side of the hall, and this lofty portion of the building is reached by a series of stairs, upon one of which the lamentable catastrophe which we record to-day took place. We may here mention that the stairs in question were specially designed for safety and convenience. The height to which they must perforce be carried is broken by landings which shorten the flights and prevent any of them from being of a long or precipitous character. The steps are each seven inches in height, and the width of the staircase, which runs between solid walls through almost its entire extent, is about seven feet. The only defects which can be fairly urged against this system of stairs is its rather tortuous nature and a certain serious defect in the matter of lighting a portion of it. It unfortunately happens that the worst-lighted portion is that in which the fatal crushing took place, and in the opinion of some persons well qualified to judge, this want of light was one of the main causes leading to the accident. With a short notice of this space, which is absolutely necessary in order that the disaster may be comprehended, we close this portion of our narrative. Let the visitor suppose himself to be leaving the gallery, which is a noble amphitheatre reached by a pair of folding doors, which swing easily in every direction. After passing through the folding doors a flight of twenty-five steps conduct to a landing 15 feet in length by 7 feet in width—that is, the width of the staircase. A sharp turn to the left must now be made, and a second flight of stairs is then reached. This part of the staircase consists of fifteen steps, which conduct the visitor to a landing of exactly the same dimensions as that which has just been noticed. Directly opposite to him will then be seen a door and a window, both of which give access to the spacious lobby at the back of the dress circle, and it is well to bear this in mind, as the work of rescue was mainly conducted by their means. From the landing in front of the dress circle door another turn is made to the left, and a corridor of 27 feet in length by 7 feet broad is brought to view. This is fairly, but not extravagantly lighted, and at its extremity and up aloft is the one window which lights the fatal flight of steps upon which the horrible scene of Saturday afternoon was enacted. To reach this flight of steps the descending visitor must turn again sharply to the left. The flight consists of fourteen steps of the same dimensions as the others we have noticed, viz., 7 inches in height for each step, with a breadth from wall to wall of 7 feet. These steps conduct to what is in appearance a well, and with the wretched light given by the single window above it is not easy for one unaccustomed to the place to see the door which leads to the final flight of steps ending at the outer porch. With the latter this narrative has no part. It was never traversed by the unfortunate children who sought to find their way from the gallery; but we may here mention that it leads not only to the gallery entrance to the building, but by a short corridor it also gives access to the main lobby, in which is the entrance to the body of the hall. The door between the "well" and the lowest of the staircase will need passing notice, as it will often be referred to in this narrative. It is a substantial portal, apparently of about 8 or 9 feet in width, and of 2½-inch plank. It will be, therefore, understood that it is very solid and substantial. It will also be well to bear in mind that it swings on its hinges either outwards or inwards. That is a circumstance about which there ought to be no mistake, as it was so arranged to afford every facility for an audience to either enter or leave the building with the utmost dispatch and safety. Unfortunately the latter consideration was sacrificed to what were deemed the exigencies of the pay-box, which is situated on one of the landings described before reaching the dress circle door. In order to check the inrush of the audience which might wish to enter more quickly than the money-taker could pass them, a bolt has been fixed to the door, and fastens in a socket constructed on the floor of the "well," 22 inches from the door frame. From this 22 inches must be subtracted the diameter of the bolt and the thickness of the door—together rather over 3 inches—and it will then be seen that the extent of clear passage between the door frame and the door was about 18 inches. This was fastened to permit only one person to enter at once, and the proper course to pursue with it was to allow the bolt to remain in only so long as the members of the audience

were entering the building. When once the house was filled, the bolt ought to have been withdrawn and the door thrown open. Had this been done on Saturday afternoon, it is possible that no accident of any consequence would have taken place; or had some of the children descending the stairs at the close of the entertainment accidentally fallen, the loss of life could not possibly have exceeded a number of five or six persons. Unfortunately, we say again, this bolt was either never withdrawn after the entrance of the audience, or, having been withdrawn, was replaced in the socket, for when the appalling disaster occurred there were only these 18 inches of space left as a passage between the dark steps and the lower part of the building.

IMPROVED AIR-WARMING AND COOLING APPARATUS.

MESSRS. ROBERT BOYLE & SON, of 64 Holborn Viaduct, have recently effected some important improvements in air-warming and cooling arrangements, which, we have no doubt, will prove of considerable value as a simple, and at the same time, economical, means of providing a supply of fresh air at such a temperature as will be both safe and agreeable in all seasons of the year. The air warmer is intended for warming the fresh air supply to a building where hot air, water, or steam pipes may not be available. The arrangements consist of a copper or iron pipe about one and a half inches diameter, placed in an inlet tube preferably of the form of a bracket. This pipe is made of zigzag shape, so as to cross and recross the tube from top to bottom, causing the incoming air to repeatedly impinge upon it in its

passage through the tube. At the bottom of the tube an air-tight chamber so far as the interior of the tube is concerned, is fixed, in which a Bunsen burner is placed, the flame of which plays up into one end of the pipe, which is connected with the top of the chamber; the heat travels through the entire length of the pipe, the other end of which may be made to either dip into a condensation pipe in the bottom of the tube, or be continued, as shown by dotted lines in accompanying diagram, up into a flue or extraction shaft. If the pipe terminates in the box, the vapour is condensed there and carried off through the outside wall by means of a small pipe, and any products of combustion which may arise are absorbed and rendered innocuous by passing through a loose bed of charcoal which covers the bottom of the box. The charcoal should be renewed about once a fortnight or month, according to the extent the tube is used. The diagram (fig. 1) shows the arrangement, which is explained as follows:—

A. Air-inlet tube or bracket made of galvanised iron and painted, dimensions 24 inches by 16 inches by 6 inches. These tubes can be treated ornamentally, to harmonise with the decorations of the room, and where necessary may be placed in chases of the wall. The top of the tube should stand about 5 feet 9 inches from the floor. B. Copper or iron tube, $1\frac{1}{2}$ inches in diameter. C. Chamber containing the burner. D. Bunsen burner. E. Opening, covered with perforated zinc, in side of tube communicating with chamber for the purpose of supplying air to the burner. F. Small lobe fitted with sliding shutter through which the gas is lighted. G. Condensation box. H. Opening in bottom of box to allow of the circulation being maintained in the heating-pipe. J. Pipe for carrying off condensed vapour. K. Continuation of pipe into flue or extrac-

tion-shaft. L. Movable bottom to flame-chamber for purpose of cleaning tube. Where the tubes are placed against woodwork all chance of fire may be avoided by fitting them with a double casing or jacket, and filling in the space between with asbestos or other non-conducting material. With this arrangement the air-supply can be raised from a temperature of 30 deg. to 130 deg., and to show that it is one of the most economical methods of heating in existence it is only necessary to mention that the cost of gas consumed to raise the incoming air from a temperature of 40 deg. to 100 deg. is less than one farthing per hour, this being effected with the air passing through the tube at a velocity of 300 feet per minute or 18,000 feet per hour.

At the Reform Club, where these tubes and heaters, in combination with Messrs. Boyle's patent air pump ventilators, have been very successfully applied, a series of experiments were carried out by the patentees in conjunction with the Right Hon. Acton Smee Ayrton, ex-Chief Commissioner of Works, to whose suggestions we may mention, *en passant*, the patentees are indebted for some important improvements in the apparatus. The result of these tests demonstrated that the apparatus was not only useful for warming the air-supply for the purposes of ventilation, but that it might be used as the sole means of heating rooms. On testing the tubes with the anemometer, the air was found to be passing in at the rate of 16,000 cubic feet per hour, the dimensions of the tube being 24 inches by 16 inches by 6 inches, one-third of which was blocked up with the heating pipes. It is important to note that these figures compare most favourably with the results obtained by elaborate and expensive arrangements for artificially forcing air into a room by means of water fans, sprays, &c., which are not only expensive and troublesome to maintain, but owing to their bulk constitute an obstruction and eyesore in a room.

The tubes are fitted with regulating valves and deflecting shields, to prevent the air from discolouring the walls. They can also be fitted with an arrangement for filtering and freeing the incoming air from blacks and dust. They are not expensive, the price of them ranging from 45s. to 100s., according to size and material used.

They are applied to a number of buildings, including the Guildhall, Lloyd's, and Royal Exchange, and have been found to answer exceedingly well.

The great objection to nearly all methods of admitting fresh air is the disagreeable cold draughts they create. The appliance we have described effectually overcomes this, and should therefore be welcomed as a really valuable addition to the list of useful sanitary inventions which are now in use.

Figure 2 shows the arrangement for cooling the air in hot weather. It consists of an air-inlet tube, of bracket form, made of

iron. The part which penetrates the hole in the wall has an outer casing, so that a space of about half an inch is left between, which is packed with a non-conducting substance, for the purpose of preventing the heat from the wall penetrating into the interior of the opening and acting upon the blocks of ice, which are placed in a movable drawer, and kept in position by means of open galvanised iron or copper wire netting. The front of the drawer is also double, and packed same as casing. The outer air entering through the grating is deflected by a metal shield on to the suspended blocks of ice, and from thence on to the ice at the bottom of drawer, and thence up the tube into the room; it being not only cooled, but purified thoroughly from blacks, dust, &c.

This arrangement, we should say, would prove very acceptable in London drawing-rooms during the season.

A in diagram denotes the inlet tube; B, movable drawer; C C C, wire netting; D D D, ice; E E E, non-conducting packing; F, deflecting plate; G, grating in wall; H, regulating valve.

TECHNICAL JURIES.

A COMMUNICATION has been addressed by Mr. Ewing Matheson, C.E., to the London Chamber of Commerce on the subject of Technical Juries and Organised Arbitration. In order to remove the evils of litigation in cases in which technical knowledge is needed as at present conducted, Mr. Matheson proposes—

1. The formation of a class of Technical Jurymen or Assessors.
2. The establishment of properly organised Courts of Arbitration.

He says: In regard to juries the modern tendency seems to be towards an abandonment of the system, and to propose any extension of it may appear to be a step backwards. But the impatience with which the jury system is often regarded in technical cases arises rather from the incapacity of ordinary juries to understand the issue presented to them, or to weigh the evidence, than from any dislike in principle to the jury system if properly applied, and just as a jury is preferred to decide in ordinary disputes, so would it be for technical cases if a suitable jury were obtainable. There is, however, no particular advantage in the present number of twelve, and a similar compromise might be made, as has been done in the county courts, where five jurymen are considered sufficient to decide cases of considerable importance. But whether they are called jurymen or assessors, and whether there be five, twelve, or any intermediate number, what is sought is a verdict from men who are as able to judge the case on its merits as a jury of merchants to decide on a commercial dispute. The present system amounts, in a great number of instances, to denial of justice, for litigants fearing either the uncertainty or the cost, in the belief that those who call the most eminent and expensive experts as witnesses are supposed to have the best chance, frequently abstain altogether from trying their case.

But how is a better class of jurymen to be obtained? The difficulty does not lie in any want of the class of men required, but rather in the method of selecting them, so as to give sufficient confidence to suitors, and at the same time not to press too hardly on the jurymen themselves. In London, at any rate, there need be no difficulty, and probably almost as little in other important centres. Dealing, however, with London alone, and at present most of the trials of the kind now under consideration come to London, the population of the metropolitan district is so large as to allow of a suitable selection without pressing unduly on individuals.

The classes I would suggest are, first, the members of those learned societies where membership implies something more than an amateur knowledge of their subject. That is to say, I would exclude those societies where membership may be obtained by the mere payment of a fee, but would include engineers, architects, chemists, &c. Secondly, all university graduates in science might be included, as a degree insures a considerable scientific training. There is another class who might form useful jurymen, but who are at present excluded by law, namely, medical men. These would, from their training, form admirable jurymen for technical questions, but the nature of their avocation forbids it in the interests of the public. It is, however, a matter for consideration whether those engaged in certain kinds of practice (an interruption of which would inconvenience only themselves) and those who have retired from practice might not be included in a technical jury list with very great advantage to the community.

Probably from the classes above indicated a body of 10,000 technical jurymen might be selected, or, allowing for deduction on account of age, infirmity, and absence, a panel of, at any rate, 5,000 available men might be secured. Assuming 100 trials per annum of the kind needing their services, this would involve serving only about once in five years.

A class of jurymen as above indicated, while select in one sense, would afford the variety essential to the confidence of suitors. Thus it would be inadvisable to settle an engineering patent by a jury of engineers, or one on the electric light by electricians; but the various classes, while affording a wide basis and variety, would, from the nature of their training, be sufficiently akin for the purpose.

Much discussion and investigation would be necessary before such a system could be established, and the details would have to be carefully arranged. Among such details would be the manner of allotting cases to the technical jurors; it might be on the joint request of the parties to the suit with the approval of the Court, or even against the wish of one of the parties, if the Court so allowed; and it might be proper to give the judges power when cases came before them with ordinary juries to refer the case to the technical jurors, just as they may do now to an official referee. It might be advisable to give suitors some right of challenge or inquiry, as in certain criminal cases; and the remuneration of the jurors would also have to be settled. Whatever might be the

exact details of the new system, its novelty alone should not forbid its adoption, and for the reference to special tribunals there are already precedents.

The question of establishing properly constituted Courts of Arbitration is already before the Chamber, and it is only in regard to the treatment of technical questions that I touch upon it here. Much of the evil of arbitration, as at present conducted, arises from the want of authority in the Court and from the want of system. When two arbitrators are appointed, with power to choose an umpire, they act rather as advocates than judges, and the umpire, where the nature of the case allows it, too often divides the amount involved. Where there is no umpire, the one or two arbitrators do the same; while, if the arbitrators had the authority which an official status and public recognition would give, they would be strengthened to judge more by the merits of the case, regardless of the effect of their decision on either party.

The want of authority is a cause of much delay and expense. Unable or unwilling to fix upon a convenient day and then to enforce attendance under the penalty of the case being heard in the absence of those who did not attend, the arbitrator adjourns cases from time to time, for weeks and even months, till a day can be found which shall suit not only the parties to the cause and their witnesses, but all the solicitors and counsel. The enormous expense of such long adjournments is known to all who have experienced them. Much of the delay and expense arises from the employment of counsel who will only attend on days convenient to themselves; whereas solicitors might, in many such instances, conduct their case with equal or better effect, and by so doing obtain better remuneration for themselves, yet with less total expense to their clients. At present solicitors fully competent to present the cases of their clients, abstain from taking the responsibility, because of the meagre scale of remuneration allowed them when costs are taxed. If proper fees were allowed, cases could be more quickly as well as more economically conducted, and solicitors would be encouraged to do the work themselves instead of handing it over to others.

Innumerable questions arise in connection with trade and manufacture scarcely of a scientific kind; but where the quality of goods, the suitability of apparatus, or the sufficiency of processes are in dispute, and if in the trial of such causes arbitrators might be chosen, not as generally happens now by the parties to the suit, but by a constituted Arbitration Court, who would select men best fitted for the case in question, the arbitrators would have an authority not possessed by those who act under the present voluntary system. The arbitrators should have the right of claiming the assistance of assessors, also chosen by an organised Court. It might even be possible to consider disputes in the absence of the parties, if some of the care at present spent by solicitors and their clients were directed to the drawing-up of a case.

REVIEWS.

SKETCHES OF COUNTRY RESIDENCES. By ERNEST NEWTON Architect. Published by B. T. Batsford.

This series may be considered to be supplementary to Mr. Norman Shaw's designs for country-houses, which were published a few years ago. Both are intended to exemplify the adaptability of Mr. Lascelles' concrete slabs. Most of the "sketches" are by Mr. Newton, a few are by Mr. Prior, and there is one by Mr. Norman Shaw. They show houses of various sizes, and all of them have the picturesqueness which happily is now appreciated by clients. As designs they are no less suggestive for use, with brick or stone in the walls. Plans are given as well as perspectives.

SCOTLAND IN PAGAN TIMES: THE IRON AGE. By JOSEPH ANDERSON, LL.D. Published by David Douglas, Edinburgh.

In his third course of lectures Dr. Anderson treats of the remains of the iron age which are to be seen in Scotland. We published abstracts of them at the time they were delivered, but in the volume there are the full reports and a great number of excellent wood engravings. A better and more readable work on the subject is not to be had. The first and second lectures treat of Viking and other ancient modes of burial. Archæologists should bless the belief in the necessity of burying arms and ornaments which prevailed among the northern peoples, for invaluable relics have been obtained from the hoards in the graves. In the third lecture Dr. Anderson describes relics of Celtic art which are of high character, although the style is now obsolete. Some of the lecturer's conclusions may be given:—

"The early Christian art of Scotland, although it had close relations with that of Ireland, was nevertheless based upon a pre-existing system of Pagan art peculiar to the area of the British Isles. Although remotely connected with certain developments of art that appear obscurely among the iron age relics of Central and Southern Europe, this special system of design received its highest development and attained its full maturity in the British Isles alone. There it became a distinctive school of decoration, exhibiting different aspects in England, Scotland, and Ireland, and attaining in each of these areas a separate development marked by a distinct

individuality of character. Its manifestations in Scotland are those of a peculiar and highly characteristic style, confining itself to curvilinear forms, combining its simple elements in a manner that is neither rigidly geometric nor fettered by conditions of absolute symmetry, but producing, by the variation and rhythmic recurrence of its peculiar features, a series of designs characterised by beauty of form, balance of parts, and harmonious combination. It differs from the art of the Christian time, inasmuch as it presents no intermixture of forms and features that are common to Greek, Roman, or Etruscan art—no interlaced work, no meanders or key-patterns or fretwork, and no similitude of foliage or foliaceous scrolls. It is zoomorphic, but its zoomorphism is chiefly apparent in the forms of the objects, and seldom exhibited on the designs with which they are decorated. It is more partial to the modelling of solid forms of ornament than to the elaborate enrichment of surface by intricate engraved work, and these solid forms of its surface-form rarely become zoomorphic."

In the fourth and fifth lectures the Scottish brochs and their contents are described. The brochs, according to Dr. Anderson, are found only in Scotland, and they were "the defensive strongholds of a population located upon the arable lands, and not in the mountain fastnesses of the country, and their peculiar nature as exceptionally secure places of refuge for non-combatants and cattle, and for storage of produce, explains the fitness of their association with the arable soil of the area in which they are most abundantly present." The sixth lecture is on lake dwellings, hill forts, and earth houses.

In describing the two volumes which contained the first and second courses of Dr. Anderson's lectures, we explained the purpose of the author. He does not describe archaeological objects as if they were only so many curiosities. Dr. Anderson employs them as evidence in order to demonstrate the degree of civilisation which was reached by Scotland when the objects were produced. Antiquities become in this way the materials for the history of periods of which no records exist, and they are more trustworthy than most records. Students have reason to be grateful to the founder who has given an impetus to the study of archaeology, and by means of lectures like Dr. Anderson's brought the results within the reach of all classes.

THE GAS MANAGER'S HANDBOOK. By THOMAS NEWBIGGING, M.I.C.E. Third Edition. Published by Walter King.

This handbook corresponds with those which are in use by civil engineers and architects, and it has deservedly reached a third edition. The pages contain an abstract of all the information that is likely to be required by a gas-engineer or manager, and for those who may be engaged in foreign work it will be a substitute for a library. A compilation of this kind represents the experience of the principal English, American, and foreign engineers and chemists. Although containing over 400 pages the "Handbook" is not too large to be carried in the pocket. According to Mr. Newbigging all the philosophy of gas management is embodied in the following golden rules: Keep up the heats of the retorts. Keep up the efficiency of the meters. Keep down the pressure on the mains. Keep down the arrears in the gas ledger.

ELEMENTARY APPLIED MECHANICS. By Professors THOMAS ALEXANDER and A. W. THOMSON. Published by Macmillan & Co.

The authors of the new treatise on the mechanics of beams and other statical structures were pupils of the late Professor Rankine, and their work is dedicated to his memory. It is intended to serve as introduction or companion to the "Applied Mechanics" and "Civil Engineering" by Rankine. His formulæ are generally found to be rather difficult to beginners, and there is more consideration for students in Messrs. Alexander and Thomson's books. The theory of stress and strain in structures is fully investigated. Examples are given under the different heads to test the knowledge of the student, and the explanations are accompanied by numerous diagrams. The two volumes will be a boon to engineering students. Some knowledge of the calculus is necessary in order to understand the whole of the reasoning, but the work has been arranged in such a way that students who have not gone so far in their mathematics can use a great part of it, and many of the conclusions are illustrated by means of graphic diagrams which are readily constructed. A work like this, which is so systematic and exhaustive, will do much towards superseding empiric modes of designing beams.

KINGSTHORPIANA; OR, RESEARCHES IN A CHURCH CHEST. Edited by the REV. J. HULBERT GLOVER, M.A. Published by Elliot Stock.

It is a good sign that so much interest is now taken in the local history of England. In a great measure it is due to the growth of the English colonies. The descendants of Englishmen who are living in all quarters of the world are glad to find some connection between themselves and the old country; and for this purpose local histories which have an array of names are of more service than the volumes of Hume or Lingard. If the list of taxpayers who lived in a parish two or three hundred years ago be published it is certain to find purchasers, and people at the Antipodes will

take pleasure in reading records of the squabbles about the election of a bailiff in an English village in the sixteenth century. The demand for books of this class has enhanced the value of the county histories, and it has given rise to books like "Kingsthorpiana." The parish of Kingsthorpe is in Northampton, and little more can be said about the place. It has not been rendered memorable by any transaction worthy of a record in English annals. But a great many of the parish documents have survived, although some are in an imperfect condition, and the vicar has thought that the best way to preserve their contents would be to print specimens of the documents in a book. They are of various kinds, ranging from grants by kings to small-beer chronicles of the expenses of the travels of the parish officers to neighbouring towns.

We must say that the interest of the legal deeds is not much, unless we take them as examples of the French and Latin used by lawyers. Manuscripts of the kind are generally of a stereotyped form, and care was taken by those who prepared them to eliminate everything that was likely to be attractive to posterity. English lawyers have always been adepts in the preparation of unreadable stuff. Occasionally the introduction of a local word or phrase gives Mr. Glover the opportunity of writing a philological note, but otherwise the deeds are only fit to give delight to black-letter lawyers.

The majority of archaeologists will find more pleasure in the extracts from parish accounts—although it may not always be certain when they were prepared; and in the by-laws for Kingsthorpe, which suggest the difficulties of local government in the reign of Edward VI. Among those decrees is one that prohibits a householder from sending for fire in a wisp to a neighbour's house under a penalty of twelve pence; by another the washing of clothes at the common wells before daylight was illegal; the cleansing of the gutters, so that the water may pass at all times, was incumbent on the inhabitants; and the "more dytche" was to be scoured as often as need should require. To deny stone or wood or other material for the king's highway, unless a man was building at the time, incurred a fine of twelve pence. According to one by-law the king and queen for the May games were to be chosen after evensong on Easter Day. If either of them declined the honour, he or she forfeited 6s. 8d., which was a rather heavy fine in a country village. The bailiff was to distress immediately for the amount, and he was to have 3s. 4d. for his trouble, the remainder going to the church. There are entries in the accounts relating to works at the church, but Mr. Glover proposes to publish some account of the church and parish registers, which probably will contain more details of building.

Correspondence

The Victoria Hall Catastrophe, Sunderland.

SIR,—With respect to this terrible disaster, permit me as the architect of the building to say that the "fatal door" on the first half-space landing of the gallery stairs was not fixed by, or under, my directions, neither did it form any part of my plans, it having been added subsequent to my connection with the work. I saw the door yesterday for the first time. I further beg to say that the stairs are not "spiral" (as stated in several of the metropolitan and provincial daily newspapers), as the accompanying plans and section will show, and the light is so ample as to allow of the staircase being photographed yesterday; but you will be able to form your own opinion on this point from the plans and section before referred to.

Faithfully yours,

Darlington, June 19, 1883.

G. G. HOSKINS.

CHURCH BUILDING AND RESTORATION.

St. George's Chapel, Windsor.—The stone vaulting over the nave of St. George's Chapel at Windsor is in a bad state of repair, if, indeed, it is not almost dangerous. Owing to the construction of the flying buttresses which support the upper part of the walls at too sharp an angle, the heavy roofing of the interior has thrust the latter outwards; and it is feared that, if the vaulting is not taken down, and the external supports strengthened, serious results will happen. From the same cause some of the walls of the side aisles have suffered also in a proportionate degree. It is understood that within the last few days the whole structure has been thoroughly examined by Mr. J. L. Pearson, the architect, whose opinion has been sought on the subject, and whose decision is supported by that of another of his professional brethren.

Barnstable.—The parish church has been reopened after undergoing a thorough restoration from the designs of Mr. J. Oldrid Scott, M.A. The contract was carried out by Mr. John Davey, a local builder, who won the highest encomiums from the architect for the way the whole work was executed. His contract was for 1,630*l*. All the old pews have been replaced by modern

pews, north gallery taken down, new windows in some parts, a handsomely carved stone pulpit, and the arcades of the nave and transept, which were removed in the early part of this century have now been restored in the style of the fourteenth century. The nave and north aisle roofs, which are ancient, have been renovated and the plaster and panels removed, now giving them a handsome appearance. A well-carved mayor's seat has been fixed, and a bishop's throne in the sanctuary.

Blyth.—A public meeting has been held with reference to the proposed erection of a new church in Blyth. The report as to the proposed site and plans of the building were laid before the meeting and were unanimously agreed to, and a building committee was appointed. The design of the proposed building is of the Norman period; the architect is Mr. W. S. Hicks, of Newcastle.

Birtley.—As a first step towards the restoration of the ancient parish church of Birtley, North Tynedale, a handsome memorial vestry tower, with bell spire, is about to be added, from designs by Mr. A. B. Plummer, A.R.I.B.A., of Newcastle-on-Tyne. In the last century plain sashed windows were inserted both in the nave and chancel. The walls of the latter are much decayed, and also the woodwork of the windows and pews. The flooring of the pews is not of boards, but of stone flags, now moss-grown, and very cold in winter. The chancel arch is Early Norman, built nearly eight hundred years since, with original abacus and chamfered jambs, as at Eglingham church; and the greater part of the old "Priest's Door" is also remaining in the south chancel wall.

Bispham.—The old portions of Bispham church, including the towers, nave, &c., have been finally cleared. The narrow Norman arch of red Furness stone which constituted the south doorway of the church, and which is attributed by Dr. Whitaker to the time of William Rufus or Henry I., has been very carefully preserved for restoring to its former position in the new structure. The new church will consist of a nave of five bays, chancel, vestries, tower, and porch. The design will be Early English, from the drawings of Mr. John Lowe, architect, Manchester.

NEW BUILDINGS.

Newcastle-on-Tyne.—An extensive range of offices has been erected at St. Peter's for Messrs. R. & W. Hawthorn, one of the oldest and largest engineering firms in this district. The walls have been carried out in red brick with stone dressings, and the interior is of oak and pitch pine. The building was erected from plans prepared by Mr. William Glover, architect, 16 Market Street, Newcastle-on-Tyne. The offices comprise partners', private, and waiting rooms, board and manager's rooms, drawing office, designing room, and counting house. Telegraph, telephone, photographer's department, and plan store. Time office, inspector's room, and general stores. The contractors were Mr. Walter Scott, Newcastle; Mr. Robert Preston, slater; Messrs. Walker & Emley, heating, ventilation, and plumbing; Messrs. Richardson & Co., painters and glaziers; Messrs. Chubb & Son, fireproof doors; Messrs. Swan & Co., electric light.

ENGINEERING WORKS.

The New Bridge, Shrewsbury.—The following report has been prepared by Lieutenant-Colonel Seddon, R.E., at the instance of the Home Secretary, upon Kingsland Bridge, at Shrewsbury: "This bridge has been thrown over the Severn at Shrewsbury to provide direct communication with the rising suburb of Kingsland, to which the Old Grammar School has lately been removed, and also by making a new road, joining the turnpike road from Church Stretton, to provide another means of entering the town from the south side at such a level as to keep the approaches to the bridge well above the highest flood waters. The bridge itself is constructed of wrought iron, on the bow and girder principle; two bows transmitting their loads to the bases of the masonry abutments 212 feet apart, and two side girders supported by the bows and carrying the roadway at a level of about 12 feet below the crown and 15 feet above the springing of the bows, the stiffness of the main girders being relied on to prevent deformation of the bows under any unequal loading of the bridge. As an additional security the ends of the side girders are anchored back so as to convert the outer ends of the bows and girders, which are intimately connected at their points of intersection, into cantilevers. It is a bridge which would be more likely to show signs of weakness when unequally loaded than when uniformly loaded throughout. As, however, I had no opportunity of practically testing it, owing to both the Bridge Company and the Shrewsbury Corporation declining to accept any risk in the matter, I can only say that if loaded from end to end with human beings, the stresses on the metal would be throughout well within the Board of Trade regulations for railway bridges. Specimens of the iron to be used in the construction of the bridge were carefully tested by Mr. Kirkaldy, and all not coming up to the terms of the specification were rejected. Also, as far as I could judge by mere inspection, there was no reason to doubt the general soundness of the ironwork. At the

same time the roadway, which consists of tar concrete resting on timber planking and longitudinals and wrought-iron cross-girders, is not strong enough to carry very heavy concentrated loads, such as steam-rollers or traction-engines. I consider that it will be advisable to limit the wheel traffic to one ton per wheel; also that the joints of the ironwork should be stopped and well painted over to keep the wet out. It has, I believe, been already decided to properly asphalt the roadway, in order to render it water-tight. There were indications of a slight movement of the wing walls just behind the Kingsland abutment, which it would be well to watch, to see if any further movement takes place. It may be merely due to a slight settlement under the pressure of the earthwork in the raised roadway, or to that, combined with the strain on the anchorage at the ends of the main girders, with regard to the sufficiency of which I am not in a position to express any opinion."

GENERAL.

Sir Frederick Leighton, P.R.A., has written to the Sheffield Society of Artists to say that, while he is unable to send any work for the forthcoming exhibition, he will be glad to subscribe 10*l.* towards the building fund.

Mr. J. W. Sandeman, C.E., has prepared plans in connection with North Sunderland Harbour including a pier of 700 feet in length, the estimated cost of which is 19,340*l.*

Mr. Mark H. Judge has resigned his position as Secretary and Curator of the Parkes' Museum, and the Council have expressed their appreciation of the services which Mr. Judge has rendered to the museum since 1878.

A Lecture on House Decoration was delivered in Glasgow on Tuesday to the members of the Local Architectural Association, by Mr. Wells.

M. Armand-Dumaresq, the French painter of battle scenes, has received from the King of Portugal the Cross of the Order of St. James.

The Town Council of Newport, Mon., last week passed building plans for fifty-eight houses, and also for a Wesleyan chapel to be erected at a cost of 6,000*l.*

The Foundation-stone of the new Roath Dock, which is being constructed at Cardiff by the Marquis of Bute at a cost of half a million, has just been laid. The water-area of the dock will be thirty-five acres. The contractors are Messrs. Nelson & Carlisle.

Eight Acres of building land at Fulham, known as Holcrofts, were sold for 16,000*l.*, at the Mart, by Messrs. Newbon & Harding, being at the rate of 2,000*l.* per acre.

A Loan Exhibition will be held in Edinburgh during the next month. Several portraits from Hamilton Palace have been lent for the occasion.

A Sanitary Inspection Association has been formed in Newcastle-on-Tyne, on the plan of the Edinburgh Association.

The "Albert Medal" of the Society of Arts, which is for distinguished merit in promoting arts, manufactures, or commerce, has been awarded to Sir Joseph D. Hooker, the director of the Kew Gardens.

Gold Articles, resembling in general character those found by Dr. Schliemann at Mycenæ, have been discovered on the northern bank of the Amu Darya, the ancient Oxus, about two days' journey from Kodus.

A Strike among the masons at Alnwick has been settled by the men returning to work at the old rate of wages, viz., 27*s.* per week, the masters being unwilling to accede to their demand for an advance of 3*s.* per week.

The Stratford-on-Avon Town Council, on Wednesday, adopted plans of Mr. Pritchard, C.E., for water-supply and sewage disposal, estimated to cost 28,000*l.*

The National Tait Memorial Committee have rejected the recommendation that a new reredos should be placed in Canterbury Cathedral as a memorial of the late primate, and confirmed their previous decision in favour of a recumbent figure, or "altar tomb."

Messrs. Robert Boyle & Son, the well-known ventilating engineers, of 64 Holborn Viaduct, London, and Glasgow, have been awarded, for their Patent Self-acting Air-pump Ventilators, the highest and only prize given for exhaust ventilators at the Hygienic Exhibition recently held at Knightsbridge, under the auspices of the National Health Society.

The Glasgow Town Council, on Tuesday, had before them a suggestion that the Corporation architect should once more inspect the theatres and large halls, to see that the exits were such as insured public safety, and it was recommended that responsible persons should have charge of the doors, and be ready to open them immediately when necessary. An inspection of all the public buildings in Glasgow will consequently be made.

A Catalogue has been issued by the Walsall Corporation, being the first part of a calendar of the deeds and documents in the town chest which extend from the reign of King John to the end of the reign of James II. (1688). A list is added of the charters relating to Walsall, referred to in the Walsall Chartulary in the Cottonian Collection of the British Museum. The work has been prepared for the Corporation by Mr. R. Sims, of the British Museum.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.The above article is now being manufactured and sold in large
quantities for Greenhouse Sashes, Public-house Shutters, and
other heavy work. The Manufacturers would recommend it for
its strength, and the large amount of wear in it, consequent on its
peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND
BLIND LINES (two Prize Medals awarded). The manufacturers
of the above articles particularly wish to draw the attention of
the trade to their Imperial Patent Flax Sash Lines, of which
they are now making five qualities; and they strongly recommend
that in all cases they should be purchased in preference to the
patent lines made from jute, which article has neither the strength
nor the durability of flax, consequently cannot give so much
satisfaction to the consumer.
They also invite the particular attention of the trade to their
IMPERIAL PATENT BLIND LINES, which are very superior
to anything yet offered.They can be obtained of all Rope-makers, Ironmongers, Mer-
chants, Factors, and Wholesale Houses in town or country.
N.B.—Please note that all our goods as advertised above are
labelled either inside or outside with our Trade Mark—The
"ANOR.".

SHEFFIELD.

The Architect.

IMPRESSIONIST ARCHITECTURE.

AMONGST the many classes of clever people who are in one sense or another the pride of our nineteenth century, not the least clever or the least interesting is the class of piquant thinkers in art, who are said to be now thinking it the right thing to do to make painting subservient to the record of first impressions only. If we

rightly understand the theory of this new philosophy, it is something like this: the minutiae of detail let us leave to Nature, for Nature alone can fitly deal with them; as for ourselves, let us be content with the generalia, the suggestive *ensemble*, the record of a glance, the shadowy semblance of a passing show which alone is the true dominion of the eye. Like many other odd ideas—like most ideas that are odd and strange—this contains more of truth than is at first apparent, indeed more of truth than to the commonplace capacity may ever be apparent; and without going further afield in the mystery of art than everyday architecture will take us, there seem to be two reflections in particular upon which, in this connection, we may not unprofitably request to be heard. The first shall be the peculiar force of what may be called first sketch architecture; the second the peculiar want of force which is exemplified by a certain kind of architecture, when fully realised in brick or mortar or whatever else—but chiefly at the present moment in red brick and white mortar and nothing else—where the design of it has been a little too careless or the conception of it a little too shadowy. In the one case we have vagueness as a virtue; in the other, vagueness as a vice; and both forms of the quality are well worth understanding.

Many of our architectural readers will recognise with charming reminiscences of pleasure what we speak of as the peculiar force of a first sketch. A designer does not require to be an artist of the highest order, even in his own esteem, to appreciate this; but certainly an artist of some sort he must be. The gentle draughtsman, for instance, who uses such a great deal of indiarubber, and who works so very deftly with his square and scales and bow-compasses of several strides, and who consequently “turns out” an elevation as neat as a new pin, and probably as devoid of all the attributes of fancy, knows nothing, perhaps, of what we allude to, or may not much care about what he does know. But this is not the way the architectural designer works whom we have in our mind. We will not admit that he is regardless of accuracy; he knows as well as his most mechanical colleague that every line and every touch in his delineation must be measurable by scale and must have its precise and definite meaning; but, nevertheless, there is a certain abandon about the every line and the every touch, the charm of which no subsequent elaboration can ever equal; and, albeit that he may amend his design in a never-ending series of happy thoughts, he finds that he has left behind him in his first sketch a sort of happy thought pervading all, which is simply as poetry to prose when compared with the best of all he can do with it afterwards. It is “only a sketch,” of course—only a sketch. But that is the beauty of it. The sketcher has found himself relieved from so much that is embarrassing by its being only a sketch, that he has flown over all difficulties like a bird upon the wing; and when he returns to the dainty lines of his squares and scales and bow-compasses of several strides, he finds he has plumped down again upon the ground.

In the sketch design, in a word, the architect of nimble thought and nimble hand has rapidly thrown his ideas into form in a sort of tentative way, quite vaguely, and, in the strictest sense of the phrase, impressionistically. This is the record of his first impression. Perhaps he may try a second edition of it, perhaps a third. If he be still sketch-designing, the second may be better than the first and the third better than the second, but this does not alter the situation. It is that the subsequent more mechanical work never comes up to

the sketch work; and we run no risk of being misunderstood by the class we are dealing with when we say that many and many a time the author, but for the sake of modesty, would fain have his little rough sketch of an hour or two put in a dainty frame and hung side by side with the fifty-guinea perspective of the executed work, as one evidence the more of the eternal difference between the ideal and the real.

To descend for a moment to profane ground, let us not forget to say that the gentlemen who advertise for managing clerks “who can design from sketches” are not always, or indeed otherwise, perhaps, than very seldom, to be identified with the sketch-designers whose particular work we have been describing; there are here (as in many other things similar and dissimilar) sketches and sketches, and we say no more.

Possibly it may be in some degree on account of the glamour which attaches to sketch-designing generally as an act of free-and-easy workmanship, and especially in connection with the prevalent custom of handling even the working drawings of an architectural design in what is considered to be a masterly style; but certainly it is worthy of note just now how many of our more fashionable edifices in red brick and white mortar are so flagrantly weak as they are in respect of artistic effect.

On paper these things, so to speak, looked all sparkling with muscularity and life. The lines were as strong as lines could be; perhaps a trifle stronger than lines ought to be. The hatching of brickwork and tilework, perhaps of timberwork, the twists and twirls of freehand decoration, the occasional tinting of doors and windows, or even walls and roofs, and so forth, were all as masculine as HERCULES. The blessed Sun himself shone on the elevation in some inscrutable way, and lent it brilliancy. The very simplicity of the composition was hardihood and manly vigour, by no means crudity or coarseness, or shabbiness of any kind, or ugliness, or want of polish or of patience. If the designer made a rush at his effect, he carried it by storm—a storm of heavy lining, heavy hatching, heavy tinting, and universal vague impressionism; the very lettering which skirmished all over the blank paper was a kind of thunder and lightning in itself, if more were wanted to fix upon the whole enterprise the universal character of “wolfish” anti-effeminacy. Probably none but the initiated could read the inscriptions; none but the initiated could read the art which it condescended to annotate.

And when we behold in the light of common day, and in the realisation of common building, the result of all this masculine heroism of paper design, and cannot help owning that it is, as it so often is, so very thin and frail and unfinished and inane, what are we to say? That the spirit of the designer has been willing to do great things cannot be denied, but that his flesh should turn out to be so wofully weak is the melancholy reflection we have in hand. To say to him that he draws not wisely but too well is, perhaps, as complimentary a way of getting him out of the scrape as we know of. We honestly do not think the English intelligence in things artistic is at all in fault. It is merely a passing whim that has produced a fiasco. But that such a fiasco and such a whim should be tolerated by criticism is more than we can consent to say. Somebody has just discovered that the function of wise men in our day is to “control” the evolution of society. If this be not a contradiction in terms, we would ask some of our leading muscularitarians in architecture to try to control the evolution of muscular red brick art a little, or indeed a good deal. What we particularly wonder is, whether the designers of this fashionable style of building are or are not penetrated with any shame or remorse or other qualm of conscience when they contemplate the removal of the scaffolding from their works? Judging by the readiness with which they repeat the offence, we should think not; but we cannot believe this of the men we know—sober, sensible, artistic souls as they are. When Sir CHARLES BARRY’S great Palace of Westminster was so far completed that the scaffolding was removed, some one took the trouble to calculate in cubic feet the difference in massiveness between the effect of deep window reveals in the perspective drawings of the Academy and the altogether shallower result of the building, and “where,” he demanded furiously, “are our so many hundred thousand feet of solidity?” Perhaps, if a similar question were asked to-day, and the unavoidable answer laid to heart, even red-brick, poor as it is, might have a fairer chance of acquiring fame in England, and its practitioners of resting quietly in their graves.

THE PARIS "CENT CHEFS-D'ŒUVRE" EXHIBITION.

THE French, as a rule, neither let their houses, nor permit the public to inspect their art collections. An Englishman's house is said to be his castle. A Frenchman's is far more so, in the sense that he admits no stranger within its walls. He will sell his house to you, but he will not let it. Our nobility in the great majority of instances allow their picture galleries to be visited at stated periods by the art-loving public. With the exception of the Duc d'AUMALE, who throws open Chantilly on Sundays and Thursdays, no French nobleman allows the privacy of his home to be disturbed by *la populace*. Loan exhibitions recently acclimatised are a step in the right direction. The first was inaugurated after the Franco-German War, in aid of the Alsatian and Lorraine refugees. Patriotic feeling, excited by recent disasters, induced the old *noblesse* to ransack their châteaux for works of art, and the exhibition of the long-hidden treasures attracted the *cognoscenti* of Europe to the palace of the Senate. In 1880 a few grands seigneurs, including the Duc d'AUMALE and the Comte de la BÉRAUDIERE, consented to part for a brief season with their WATTEAUS, FRAGONARDS, BOUCHERS, &c., to illustrate a special period of French art at the Exposition des Arts Décoratifs. This spring an appeal made for a charity entitled "L'Hospitalité de Nuit," suggested the loan of family portraits. The Beaux-Arts lent their galleries, and the public crowded thither to study the features of their LAMARTINES, their GUIZOTS, their THIERS, &c., in such numbers that the goodly sum of 4,000*l.* was added to the funds of the night refuge for street Arabs. Charity has again appealed to the *noblesse* of the Faubourg St.-Germain in the cause of the Ecoles Libres (an institution founded by a group of men desirous of supplying religious, as well as secular, education to the children of the poor), and with what magnificent results will be manifest to the visitors of the exhibition now open in the Rue de Sèze. The collection consists of one hundred *chefs-d'œuvre* of the school of which DELACROIX, THÉODORE ROUSSEAU, MILLET, COROT, were the masters, TROYON, DAUBIGNY Père, JULES DUPRÉ, DÉCAMP, and DIAZ, the disciples. Mr. STEWART, of New York, exhibits his FORTUNYS; MM. BISCHOFFSHEIM, PÉREIRE, and MEISSONIER their MEISSONNIERS. The Duc de MORNAY, the Princesse de SAGAN, and the Comte de POURTALES contribute some of the old masters. The Comte de GREFFULHE promises to add to these the TENIERS for which he gave six thousand guineas at the Delessert sale, as soon as the ball is over with which Madame la Comtesse will close the Paris season. Two firemen are on the premises day and night. *Du reste*, the committee, consisting of the Duc d'AYGEN, the Marquises de GANAY, de MASSA, de VOGÜÉ, and the Comtes de BAILLON, de CHESNELONG, and d'HARCOURT, have insured the collection for half a million sterling.

The visitor on turning to the left upon entering GEORGES PETIT's gallery, is at once in presence of two *chefs-d'œuvre* by TROYON. They might be entitled Storm and Sunshine. In *L'Arc-en-ciel* the storm has subsided; against a drifting bank of clouds a rainbow is faintly discernible; a white cow near a pool of water stands in strong light because of a rift in the sky to the left. *L'Abreuvoir* shows horses crossing a stream. A farmer, clad in blue, rides a white horse into the water; his stable-boy, in the act of tugging very unnecessarily at the head of a gray mare, who seems willing enough to cross, pulls up part of his shirt and reveals a scarlet under-garment, which bit of red, mathematically speaking, in the centre of the picture is the key-note of the whole. On the left are poplars thrown out by the silvery gray of the sky. On the opposite shore is a line of low houses sheltered by trees. Next to these hangs the picture which perhaps attracts as many of the 1,700 odd visitors who daily throng the gallery as REMBRANDT's *Doreur*, bought in by the Duchess at the late Duc de MORNAY's sale for 4,000 guineas. Yet the canvas in question brought a poor ten pounds to GARBET, a clerk at the Préfecture de la Seine, who, with the idea that he had no talent and still less genius, painted on Sundays only or on a rare holiday, and so it took him four years to produce a *chef-d'œuvre* for which the Baron de GOETHALS, a Belgian, had to pay 6,000*l.* a few months ago. Thus is it ever. GARBET scribbling at a desk, perhaps in a gloomy office, for bare existence, was coining gold for others to gather. The fair of St. Germain is at its best. In the foreground are groups of *bourgeois* with their wives, proud of their coach-wheel bonnets, gaudy shawls, and limp

gowns, as were worn in the early years of LOUIS PHILIPPE's reign. Among them is the village *curé*, hat and breviary in hand. Behind these are irregular awnings of all shapes and colours, beneath which vendors of lemonade and cocoa have established tables. The people crowding round these are in half light, not only because of the awnings, but because of the dense foliage of a clump of trees in the rear. Some yards beyond is a white tent surmounted by a tricolor. The day is serene, perhaps even hot. The foreground recalls a *Kermesse* by TENIERS. The exquisite ethereal quality of the atmosphere, the pale cerulean tint of the sky, might be the handwork of BOTH. The *Italian Potters*, by DÉCAMP, is remarkable for the effect of strong sunlight on the yellow wall of the bottega, in which a man in shirt sleeves turns a vase; his child plays with a cat by his side; his wife and three women are in the background. The picture has been lent by the Prince de BROGLIE. By THÉODORE ROUSSEAU we have *Oaks in the Forest of Fontainebleau*. ROUSSEAU, it will be remembered, was one of the founders of the Fontainebleau school, and in order to study nature *sur place*, lived at Barbizon, a village close to the Gorges d'Aspremont, where THÉODORE ROUSSEAU, MILLET, ZIEM, and BRINDEL inhabited a house now belonging to the artist JACQUES. A clump of trees, and only a clump of trees—but how rendered! It is summer. Their shadows are projected in black tracery on the sward, for the sun is at its meridian, and inundates the plain with its clearest light. Cattle feed in the cool, sheltered space beneath the dense foliage of the oak, but thirst tempts two or three to a pool of water, where they drink. Miles away stretches the plain, traversed by a sluggish stream. The treatment of the trees is reminiscent of HOBBEEMA. *Chien aux Ecoutes* is a portrait of a dog, and a picture to rejoice the heart of a master of hounds. Next to these hang FORTUNY's *Choix d'un Modèle*, his *Porte de Justice à l'Alhambra*, and his *Déjeuner*. Truth to confess, *ils font tache*, among the sober-tinted TROYONS, ROUSSEAUS, and DÉCAMPs, but let us not be misunderstood. We are true to our allegiance to the marvellous genius whose sun set all too early for its lasting glory. His luminous touch, his intuitive sense of harmony, his power of reproducing brilliant tone, have never been surpassed; the proof of his genius lies in the fact that of his many imitators not one has even approached him. But it was a mistake, *selon nous*, to exhibit his works at this special exhibition. To COROT's *Girl Riding a Tiger* we prefer *Le Ruisseau*, and especially *The Lake*, belonging to M. ALBERT WOLFF, the art critic. On the right is a pathway leading to water-steps, overshadowed by trees. The spot, cool and sequestered, has induced some young girls to select it for their place of repose. The silvery surface of the lake extends indefinitely to the horizon. The scene in itself is full of romantic beauty. COROT has rendered it with the fascination of his best day. FORTUNY's *Dead Jewess*, clever as it is, is inferior to Madame O'CONNELL's *Dead Rachel*, painted for M. de GIRARDIN, and now the property of Prince NAPOLÉON. Near this hang a TENIERS and an OSTAË. By the latter is *La Halte*. A cavalier has stopped at the village inn to have his powerful white horse fed; a gentleman mounted on a roan hands a glass of wine to a foot-passenger, who drinks to his health; a groom holds a couple of hounds in leash; beneath a clump of trees on the right a peasant is seated. Very beautiful is the central figure in TENIERS' *Vue de Flandre*. A woman, clad in delicate blues and pinks, stands at a well, and while her bucket descends, turns to speak to a farmer in a blue coat, who, with others, is about to enter the village inn. The grace of the woman's attitude, the golden light in which the scene is painted, and the vanishing landscape are well worth studying.

In somewhat dangerous proximity to these are several COROTS and ROUSSEAUS. By the latter master is *Bords de Rivière*. Trees are on either side of the river. Those on the opposite shore are reflected on its surface, which also mirrors the pale blue of a sky flecked by white clouds. The foreground is intensely dark. Baroness de ROTHSCHILD has lent ROUSSEAU's *Matin* and his *Soir*. The former is a study of trees in a richly-wooded country. We have the silvery gray of the willow and the polished deep green of the beech; a stream wending its way through the wood disappears in the distant plain. The light is clear and brilliant, for it is the morning of a summer day. The *Soir* represents an evening in autumn, typified by a group of silver beech, whose scant foliage October has turned to pale yellow and red gold. Brown,

deep green, and ruby are the mosses which carpet the ground at their base. The sun has set; the heavens have assumed the tint of a dark sapphire. Along a hollow ravine to the left a cavalier is riding.

MILLET's works, ignored during his lifetime, are now worth fabulous prices. *L'Homme à la Roue* was a picture much abused when exhibited in 1863 at the Salon. MILLET thus wrote regarding the animadversions of the press with regard to it: "The comments on my *Homme à la Roue* are strange. People assert that I deny the charm the country possesses. To me the country has more than charm; it has infinite magnificence. I see the little flowers, of which CHRIST said, 'SOLOMON in all his glory was not arrayed like one of these.' I see the beauty of the meadow grass, with its countless peaceful spears, and I see the sun spreading his glory far away on the firmament; but I not the less see the steaming horses dragging the plough, and in a rocky waste a wearied man whose "hau" has been heard from early morning, and who endeavours to stand erect for a moment and breathe. The drama is surrounded by nature's beauty. I have not invented the subject. *Le cri de la terre* is an old expression." Considered in the light these lines throw on the subject, the picture becomes a poem. In the man with worn and weather-stained features, stiffened by stooping over his work—in the wife gathering weeds for burning, we have a concretion of the characteristics of MILLET's style. The *Glaneuses*, which is hung further on, show women bearing the heat and burden of the day's toil. Two are bending to their task—that of gathering fallen wheat ears. One stands to collect these in her coarse apron. In the distance a farmer and his sons are lading carts. Sunshine glows over the scene, and touches with lovely brilliance the pinks and blues and soft grays of the women's attire.

MILLET's *La Femme au Rouet*, described among the pictures in M. COQUELIN père (the actor's) collection, and *La Lessiveuse*, are hung near several of MEISSONIER's, whether to mark the opposing styles of the two great masters or by mere accident we know not, but their proximity suggests some thoughts with regard to both. The one gives his dominant quality, realisation, with massive firmness. His men and women are sturdy labourers, who gain their bread by the sweat of their brow. They are neither refined nor beautiful; their clothes are homely. The sentiment expressed touches a chord of human sympathy; but he appeals to the sense of beauty by the manner in which he paints the landscape in which his peasants toil, and by the quality of the atmosphere in which they are enveloped. MEISSONIER, on the contrary, looks at men and women, fresh from the hands of their tailors, their embroiderers, their wig-makers, through the lens of a microscope. With marvellous cunning, he gives the braiding on a uniform, the ribbons on a *justaucorps*, the grains of powder on a LOUIS QUINZE wig. You can count the hairs on an eyelash. This skill we remark, not presumptuously to detract from the great artist's merit, but *en passant*, as we pass from a MILLET to a MEISSONIER in juxtaposition at this special exhibition. MEISSONIER's *Amateurs de la Peinture* belongs to Vicomtesse de TREDEBN. GREUZE perchance, or FRAGONARD, in a suit of blue brocade, is painting on, utterly regardless of the connoisseur in a white coat who leans over the easel, his tricorne held in both hands behind his back, while two other cognoscenti seated behind the painter express their inane criticisms by words and gestures. A screen of Cordova leather not only shelters their valuable persons, but serves as an admirable *repoussoir* for the strawberry and chocolate tones on their silken coats. The artist's works, hung on the wall in the rear, create a mass of rich and dark colour. The master himself lends the two works which he considers as his *chefs-d'œuvre*, and for which he has refused 12,000*l.*, as he has bequeathed both to the nation. One is *Graveur à l'Eau-Forte*, the other *A la Fenêtre*. In the first, the engraver COCHIN perchance, or GRAVELOTTE, clad in a loose robe of crimson, is intently studying the effect of his work. Light is carefully subdued by a plate of dulled glass fixed to the window, which is quarry-glazed, and by a partially closed shutter. Softly—shyly, as it were—a ray enters and falls on the head of the engraver; it rests on the upper part of his figure and touches the olive velvet back of a chair. In *A la Fenêtre* a man of LOUIS XIII's court has risen from a table covered by a Persian carpet and has opened one of the wooden shutters of the windows, from which he looks out on the country. His figure is in half-light; a sunny ray strikes on the corner of the table and on the floor.

Reconnaissance dans la Neige was described in these columns when exhibited at the Mirlitons, as was *Polichinelle*, which M. MEISSONIER was painting when the writer visited his *atelier* to take notes for a biographical sketch. *Les Joueurs de Boule* measures some 12 centimètres by 18, in which space seven figures are playing at ball; several passers-by are looking on, the clothes of the players are ranged beneath the wall of the house, in the shadow of which the game is going on; furthermore, there is the sea and a fort in the distance; the figures measure about one inch in height.

Above these *tours de force* hangs TROYON's *Vallée de la Touque*, exhibited for the first time to the public. It has the firmness, the freshness, the delicacy of an artist in his prime. We are in the open country; a clear rivulet, crossed by a bridge of planks, waters the meadow-lands on which cattle are at pasture; a splendid bull looks straight at you; some cows are lying among the reeds and sword-grass by the water's-edge; light is on the near water (save where the dark shadow of the bridge falls) and on one of the animals. The treatment of the animals is reminiscent of CUVY. This is considered to be TROYON's finest work. Baroness de ROTHSCHILD's *Vaches à l'Abreuvoir*, his *Bœufs au Labeur* have the same qualities; but the fact that M. GOLDSCHMIDT paid 70*l.* for *La Vallée de Touque* a quarter of a century back and lately refused 10,000*l.* for it, invests this special canvas with a certain interest in the mercantile world. A splendid HOBBEEMA, lent by the Princesse de SAGAN, although hung in its proximity, proves no dangerous rival. The figures in this beautiful work were put in by LINGELBACH. The scene lies at the entrance of one of the primeval forests of the north; a small forester's house is almost hidden beneath the grand old oak, at the foot of which it seems to nestle. The sky is charged with slowly-moving clouds, illuminated from the horizon. Light, struggling as it were through the densely-tangled branches, scarcely reaches the foreground.

M. ANDRÉ has lent his REMBRANDT, a prosperous burgermeister, who wears his broad beaver with a well-to-do air; he was a fair man in his younger days and had reddish hair, his moustache and short beard are gray now, and his complexion somewhat tanned. The rival REMBRANDT, *Le Doreur*, is too well known to require description. It was the gem of the first Duc de MORNAY's gallery, and taken by him to Russia when he represented France at the late Emperor's coronation. *Le Déjeuner de Jambon* is one of TENIER's best known works. The good man who cuts the slice from the loaf while he talks to the old lady in the close cap and ruff, the fine old peasant partly turned from the table on which is the famous ham, are as fresh and living as though painted yesterday. Above this graphic picture of the manners and customs of Dutch peasant life, hangs an equally graphic picture of the manners and customs of French court life by LANCRET, entitled *La Partie de Cartes*; the one typifying unrefined but honest human nature, the other the most refined and most dissolute society the world has as yet known. Graceful are the women who stake their gold at lansquenet, and handsome the men, whose swords so readily avenge a slighting word or a stinging epigram. A cardinal in his scarlet looks on approvingly. The salon in which the game is played is pure LOUIS QUINZE. Why will not house decorators study from an authentic source such as this, or other pictures of the period, their LOUIS XV. style, and spare us the hideous caricatures of its real gracefulness by which our peace is so often disturbed?

A very beautiful TERBURG is *Sa jeune Femme à la Toilette*. A waiting woman in a dark dress arranges a string of pearls in the fair hair of her lady, who, seated on a chair, wears a skirt of white satin beautifully embroidered in gold and a bodice of yellow satin. The Flemings are clever managers of colour. In the centre of the picture is a vacant red chair; on it hangs a purple cloak, against which lies the white satin of the lady's robe. Its creamy tint is thus set off, as is the gold colour of her corsage, by the red on the arm of the chair on which she leans. A page bearing a beaker on a silver dish advances from the right. Needless to remark, the back of the chamber is intense in darkness. FRANZ HALS' *Leve de Frouw* is characteristic of his countrymen and of his times. A slightly inebriated young burgher, attired in a black suit, over which he wears a sleeveless jacket of sad-coloured cloth, which hue is repeated in his broad beaver adorned by a drooping green feather, has drunk to the health of his *fiancée*, a buxom lass, who leans confidently on his arm. The youth holds the glass steadily enough high above his head, but the flush on the cheeks of the pair tells of copious libations to the god of love. Their eyes twinkle with

merriment, they laugh for very joy, their boisterous spirits are positively infectious. There is another splendid FRANZ HALS. The subject of *L'homme à la Canne* is clothed in rich velvet braided in gold; the gentleman is seated on a chair ornamented with gold nails. He leans on his cane; his eyes sparkle with wit; he has been a beau in his day, and even now his hair is crisply curled and his moustaches *fièrement retroussées*. A GREUZE, lent by the Duc de la TRÉMOUILLE, probably the portrait of some fair scion of the race which gave to us the gallant Countess of DERBY, who defended her husband's castle with such unflinching courage. A *Vestale*, also by GREUZE, a splendid VANDYCK, a curious ANTONELLO DA MESSINA, and a very beautiful FRANCIA are among the examples of the old masters arranged at the end of the gallery.

There remains to us but the wall on the right to examine. Here we find a GÉRICAUT, *Hussard à cheval*, powerfully painted in a broad masterly manner. Light from the left strikes on the white furred pelisse slung on the left shoulder, on the red cloak fastened to the saddle, and on the hind-quarters of the dappled gray charger. The man's features are thrown into deep shadow by the steep peak of his high busby. Young HENRI REGNAULT, whose memory will descend to posterity linked with the recollection of his glorious death, like FORTUNY, died too young for his fame, which had not reached its culminating point. In his *Départ pour la Fantasia* there is something stagey in the attitude of the sheik who suddenly pulls up to speak to a young Arab on foot; the horse is thrown back on his haunches precisely as is the charger ridden by General PRIM in REGNAULT's portrait. The picture is flooded by sunny light. A reduction by DELACROIX of his large work *Les Croisés à Constantinople*, his *Cavalier Grec*, and his *Christ sur le Lac de Génèsareth* are fine examples of that great colourist. DIAZ floods his landscape with glowing light as our DANBY was wont to do. *La Mare*, a setting sun which still shows a portion of his disc above the horizon, throwing into shade the distant village, but casting long clear sweeps of rays upon the wide plain, turns to gold the waters of the pool at which cattle are drinking. To right and left are trees, which thus concentrate the light on the "mare." The vegetation varies between fresh and verdant greens, withered duns, and autumn yellows. Four of the thirteen COROTS exhibited are near the DIAZ, with four FROMENTINS, one of which is the celebrated *Campement Arabe*, exhibited by Baroness ROTH-SCHILD. The last picture on the right as we leave the gallery is a gem called *Dame Assise*, by no less a master than FRANZ HALS. It measures but a few inches, and yet has all the transparent tone and splendid *maestria* of that great artist's manner.

So many visitors daily crowd the gallery, it is with difficulty a good view of the pictures can be obtained.

ARCHÆOLOGY IN ATHENS.

EFFORTS are being made, not for the first time, but now under more favourable auspices than hitherto, to call public attention, and in particular the attention of the wealthy, to a scheme for the foundation of an English school of archæology in Athens, to take its place there beside the schools of France, Germany, and America. Apparently there is no hope of assistance on the part of the Government, though the favour of the Prime Minister may be inferred from the fact of his offering individually a subscription to the scheme. He and Lord GRANVILLE were present at the meeting on Monday at Marlborough House, while the next Government may be said to have been represented by the presence and support of Sir STAFFORD NORTHCOTE and Lord CARNARVON. Yet it is a matter of the first importance that the school should be under Government protection. For, though Greece is a safe enough country for travellers who can afford to make their way with a considerable show of power of purse, and is even quite safe enough for a humble traveller who knows the people and the language, still there are in many places possible elements of discord, which it is of the utmost consequence to be provided against by anyone who would start into the interior alone, and with small visible means of profit to be made out of him. The students of the French and German schools travel safely in this manner. But then it is known who they are wherever they go. Possibly their knowledge of the people and their language would be sufficient to protect them. Still, the fact of their respective Governments being at their back goes far.

The American school, established as it is merely by universities and private subscribers, may in time prove that no such Governmental ægis is necessary. For the present we are inclined to doubt.

The universities of Oxford and Cambridge are great powers in our midst, and it is quite pardonable of those who stand high in the atmosphere that surrounds these seats of learning to think that a student fortified with this protection would be safe wherever he went in Greece. As a matter of fact, Oxford has made an experiment by sending a travelling Fellow into Asia Minor. He has made a number of successful journeys into the interior, and has published in various quarters the results obtained by him; but it will be seen that his principal adventures have been made under the safeguard of a consular official of the highest standing. Yet he is undoubtedly a most intrepid traveller, such indeed as could not be regularly counted on from our universities. Of course Asia Minor is generally more or less unsettled, as compared with Greece, and so far the experiment of Oxford would not apply. In Greece students less qualified for active exploration would find abundance of work easily within their reach.

It is not, however, altogether a question of safety for the students. As matters now stand there are few subjects of interest in classical antiquity which can be pursued without a constantly-recurring desire to excavate and explore here or there. For the student travelling in Greece it is indispensable to have occasionally the means of verifying his surmises by actual excavation. French and German students can refer such questions to their respective institutes, where the necessary measures are taken to set about the work. For example, a German student interested in the ruins of Tegea, in Arcadia, was able, in this manner, to clear part of them, and to ascertain some very interesting facts about the architecture of the temple built by SKOPAS. Or, without leaving Tegea, another student found in the small museum there some remains of the sculpture of the temple, as he supposed, and by referring the matter to the institute he was able to get casts made from them to be sent home to Germany. Similarly, the French school has, of recent years, conducted excavations at Delphi, and still more successfully in Delos.

Now in the proposals for an English school there is no provision for work of this kind. Possibly it is reckoned on that the supply of funds may be sufficient to allow of occasional excavations. Or a society like the Dilettanti may, when it next proposes excavations in Greece, be willing to utilize the services of one or other of the students in the prospective English school. Or, again, the Government might, on occasion, make a grant for some special enterprise as it has been in the habit of doing. But, on any of those possibilities, it seems to us that the machinery, as at present proposed, would not work well; whereas, with the Government as the founder of the school, everything would go smoothly. It may be said that the Government has no relationship to the universities of Oxford and Cambridge, such as exists in Germany and France, by means of which a due supply of students is maintained. In regard, however, to the Scotch universities the Government provides an annual grant, and could easily allocate part of the same to the maintenance of a school at Athens, to which students from the Scotch universities could proceed. It would be for Oxford and Cambridge to put themselves in a similar position. For the moment the scheme looks not at all like a national movement. If it succeeds, the product will be an Oxford and Cambridge school in Athens. It would be infinitely better if the Government would take it in hand, and make it really national. The difficulty, we suppose, lies mainly in the constructing a new set of administrative machinery by which the whole business could be worked with advantage. A mere annual grant is by no means all that is required. Where, for example, would the results obtained by the researches of the students be published? The reports prepared by them should be communicated regularly to the public; but by what instrumentality? A journal printed in Athens and edited by the director, like the journals of the German and French schools, would utilise part of the labours of the students. But much, it is to be hoped, would remain over. France, with its institute, knows how to deal with this surplus. A commission of some sort would be necessary, acting, perhaps, under "my lords" of the Privy Council.

The position of the director of the school, as contemplated in Professor JEBB's scheme, would obviously be inferior to that of his French and German colleagues. He would have neither

their power nor their resources; and in a country like Greece it is necessary to stand well in both these respects, if any real work is to be done. Still more would it be necessary for him to stand well in these respects if the school were largely, as no doubt it would be, used by the numbers of educated English visitors, who in the few days they spend in Athens usually expect someone to remove at once every obstacle they meet with. A director must have a strong and secure position to be of service to them. He must have a strong and secure position even to be able to decline moving mountains for them, in view of the inevitable letters to the newspapers that would follow. As the nominee of a committee responsible to a number of subscribers he would have no such authority, even if these subscribers were mainly public bodies, such as universities, colleges, the Royal Academy, the Institute of Architects. Responsible to the Government, and protected by it, he would know how to act. He would be the equal of his colleagues from France and Germany, and his students would be the equals of the French and German students.

PARIS NOTES.

THE *Salle du Feu-de-Paume*, or tennis-court, at Versailles, which was last week inaugurated with much solemnity as a museum by M. Jules Ferry, the Prime Minister of France, has been restored and re-arranged, as in 1789, under the superintendence of M. Edmond Guillaume, Grand Prix de Rome, and architect to the Louvre and Tuileries. Around the hall is painted a Greek frieze bearing the names of the seven hundred deputies who signed the report of the meeting, while twenty busts of the most eminent among them are arranged around that of Bailly, their president. On the north wall is a copy in camaïeu, by Olivier Merson, of David's celebrated picture of the scene; on another wall are seen inscriptions of the congratulatory address voted by the Convention to the town of Versailles, and of the decree issued on March 24, 1848, by Ledru Rollin, then Minister of the Interior, while on each side are the stanzas of André Chenier written in celebration of the event. A number of glass cases and stands, containing souvenirs of the Great Revolution, complete the museum.

During the present week the works of art sent by winners of the Grand Prix de Rome, who, it will be remembered, pass four years in the Italian capital at the expense of the French Government, have been on view at the Ecole des Beaux-Arts. As usual, the paintings and sculptures form the principal and most interesting portion of these *envois de Rome*. The pictures are five in number, the largest and, perhaps, the most noteworthy being from the brush of M. Schommer (in his fourth year), representing *Edith Finding the Body of Harold on the Battle-field of Hastings*. The general tone is gray and sad; the foreground covered with boulders, amongst which lie the corpses of the fallen combatants, while in the background is caught a glimpse of the beach and sea with the sun rising over them. In the centre stands "Fair Edith," supported by a couple of monks who have accompanied her, but she does not quite impart the idea of passionate grief in keeping with the occasion; on the other hand, the face and figure of one of the monks gazing down on the body of the last of the Saxon kings are excellent in conception and drawing.

The *Ave Maria* of M. Doucet (2nd year) affords some curious and not altogether pleasing colouring, but the face of the Virgin—of a marked Italian type—is good, and considerable ingenuity has been employed in devising the robes of the angel kneeling before her. Thus the *ensemble* is striking and attractive. M. Brantot (3rd year) contributes a small but pretty camaïeu, *Les Amis de Job*; and his copy of a Raphael displays much technical skill. M. Fournier, the junior of the four both in point of years and study, exhibits an *Orestes taking refuge at the Altar of Apollo at Delphi*, which shows promise. Owing to the death of M. Grasset, and to an accident which prevented M. Fagel from completing his bas-relief in time, the sculptures are very few in number, the most noteworthy being those of M. Labatut (1st year), who sends a copy of the *Esquiline Venus* brought to light a few years ago, and a bas-relief representing *Mercury descending from Olympus and handing the Apple of Discord to Paris*. Both of these productions are characterised by vivid imagination and powerful execution, the first-named in particular giving the sculptor the right to claim the palm, not only in this section but in the exhibition as a whole.

The distribution of the prizes at the Salon took place on the 22nd inst. at the Palais de l'Industrie, the ceremony being presided over by M. Jules Ferry. M. Bailly, President of the Société des Artistes Libres, announced amidst applause that the Government had just declared the Association of public utility. M. Jules Ferry in the course of his speech endeavoured to show that the triennial Salon instituted by the State would never be prejudicial to the interests of the annual one; but, judging from the coldness with which his remarks on this subject were received, he by no means succeeded in convincing his audience that such would be the case.

The Committee of the Artists' Association, by which the annual exhibition is now managed, has decided that in future any exhibitor who shall remove, damage, or destroy his work while on show, from dissatisfaction at the position assigned to it or from other motives, shall be excluded from all future Salon exhibitions. The Committee further established the maximum dimensions for frames at 12 inches width and 8 inches thickness.

The Salon this year remained open 46 days, without counting the four days set apart for re-hanging, and the number of visitors amounted to 514,083. Of these 285,000 were admitted free, 11,230 at 5 frs., 23,906 at 2 frs., and 193,947 at 1 fr. The entrance receipts thus reached 297,909 frs., to which there are added 31,000 frs. produced by the catalogue, 14,000 frs. paid by the refreshment contractor, and 8,000 frs. sundry receipts, making a total of 350,909 frs. Against this amount must be set 185,000 frs. expenses, so that the net profit realised by the Association is about 165,000 frs. Comparing these figures with those for the two preceding years, a very considerable falling off is apparent; for the entrance receipts, which were 321,002 frs. in 1881 and 349,266 frs. in 1882, are found to have declined more than 50,000 frs. The papers attribute the falling off to the influence of bad times upon the Parisian public, and in this they are probably correct, for there has certainly been no decrease in the number of foreign visitors, the general impression of *habitués* of the Salon being that in no former year have they mustered in such force.

The jury in the painting section of the Triennial Retrospective Exhibition has completed the first portion of its task. Out of upwards of 800 pictures proposed by way of written notice, 409 have been admitted right off, the remainder being adjourned for examination between August 10 and 15, together with the other works that may be presented in the meantime. In consequence of this decision, the delay accorded to artists for sending in exhibits for examination is extended by three weeks, the latest date being altered from July 20, as originally fixed, to August 10.

At a sale of water-colours held at the Hôtel Drouot last week, some high prices were realised. *A Dragoon on Vedette Duty*, by Meissonier, fetched 9,700 frs.; *Troops on the March*, by Louis Leloir, 6,300 frs.; *L'Andante*, by G. Vibert, 13,700 frs.; *The Victorious Toreador*, by the same, 8,000 frs.; *The White House*, by Jacquemart, 2,855 frs.; *Avenue de la Grande Armée*, by the same, 950 frs.; and *On the Terrace*, by Heilbuth, 3,800 frs.

About fifteen months ago the Minister of Public Instruction laid the first stone of a new public Lycée or College not far from the Trocadéro, to be opened under the name of the Lycée Janson-de-Sailly. Operations have been pushed on with great energy, and a year has sufficed to complete the masonry and heavier portions of the work in this vast building. Tenders are now invited for July 12 next for the remainder of the work, the estimates of which are 38,900 frs. for roofing, 484,000 frs. for carpenters and joiners work, 147,000 frs. for painting and glazing, and 101,000 frs. for locksmiths' work and other ironmongery.

The Academy of Fine Arts has awarded the Alhumbert Prize to M. Deblois, copperplate engraver, Grand Prix de Rome, who has also gained the Cambacérés Prize of 1,000 frs. The successful candidates in the preliminary stage of the annual Sèvres competition are M. Carrier-Belleuse, pupil of his father, the celebrated sculptor; M. Clerc, pupil of the National School of Decorative Art; and M. Marion. The compositions of these competitors will be exhibited at the Ecole des Beaux-Arts, that of the winner in the final composition becoming the property of the State.

In the annual architectural competition at the Ecole des Beaux-Arts, first medals have been awarded to MM. Duroy, Pied, and Bertrand; and second medals to MM. André, Landry, Lacombe, Socolesco, Louvel, Peigny, Saleron, and Flandrin.

ENGLISH AND FRENCH RENAISSANCE.*

I HAVE been asked to read a paper to-night on "The Early Renaissance in France and England," but it will be well to say a few words on the subject generally before considering these countries in particular. First of all, let me say that I am a great admirer of the Renaissance styles; the attacks that have been made on them all appear to me to be illogical and inconclusive. Mr. Fergusson's idea that the arts were original until some time in the fifteenth century, when they became a copyism of what went before, does not seem to tally with the facts. If we look at actual buildings of the Renaissance in the early days when it was at its best, it differs from the antique as any other style differs from its prototype—the Gothic from the Romanesque, for instance—and if it be objected that each of the other styles grew out of the one that immediately preceded it, so did this. It is a legitimate growth on the Romanesque, helped by the study of such antiques as might be found. The style was certainly much less an arbitrary selection than many others that went before, as, for instance, the revival in Egypt, and the new Attic school in Rome; and, indeed, the Gothic in Italy, which was always alien, and has no distinctive place, running parallel with the other more natural growths. To me the arts are continuous, with certain cycles of development, but an unbroken sequence and tradition. Why should it have been the right thing for the old men of the Quattro-Cento to shut their eyes to the influence of any particular preceding style? That, indeed, would have been an arbitrary eclecticism which fortunately never seems to have crossed their minds, and so the history of art becomes a true history of the human mind, reflecting the sum of the influences that may be at work.

Ruskin's criticism is moral, and he sees in our style corruption and heartlessness; but this can surely have little weight when he admires so profoundly the painting and sculpture of the same age, which is a part of the same development as architecture, and practised by the same men. How can Michael Angelo at the same time have a corrupt and a divine mind, according to whether he embodies it in architecture or sculpture? Can the same fountain bring forth both sweet and bitter?

Then we have Pugin and all "True Principle" and utility doctrines. The chief idea of this sort of criticism seems to be that the employment of the same form structurally and ornamentally must be wrong, and hence their vituperation of attached columns and decorative pediments. But not to go into the abstract question, cannot the same argument be more than rebutted on Gothic decorative arcades and useless columns, the woodwork all designed on a stonework model, and even little iron locks, being a church end in small with traceried window and buttresses on either hand? Indeed, the notion of a traceried window is the one great idea of the style, and when seized on, did duty alike to light a cathedral or decorate a seat end, a floor tile, or all manner of iron-work. Chaucer speaks of a foppish priest who had his shoes embroidered with the rose windows of old St. Paul's—this is the "extremity" of truthlessness.

During the whole of the eleventh and twelfth centuries in Italy the Romanesque and Byzantine styles were declining, but early in the thirteenth century a new force seems to stir the mind, and a new cycle commences, indisputably the same to which belongs Brunelleschi and Bramante. It is the Renaissance, which culminated in literature speedily in Dante and Boccaccio, then in sculpture and architecture, and lastly in painting. Vasari's great work, the "Lives of the Artists" (which, by the way, contains a most interesting digression on this fact of the earlier development of sculpture and architecture than of painting), is really the history of the Renaissance in art. He divides it into three parts. Infancy, from about 1230, when Niccolò Pisano was at work, to the birth of Jacobo della Fonte in 1374. The second, which to a great many is the most precious age, is that of Donato, Brunelleschi, and Perugino. And the third, the age of full development, dating from Leonardo.

Here more clearly than anywhere you see the growth of the new idea from the beginning, when Cimabue and others received the tradition of painting direct from the Byzantine masters, and the Pisani were already studying the antique. It is just at this time that such Gothic work as there ever was in Italy was being done, just when their own powers were at the weakest between two developments. The style which had obtained strength in France and Germany was impressed on them from without, France acting in the south on Sicily and Naples, and Germany in the north. Vasari, indeed, ascribes this work mostly to German workmen, and it was carried on side by side with the Renaissance. So that Milan Cathedral (about 1400) and the west front of Como (1465), two of the best known specimens, were actually being built while Ghiberti, Brunelleschi, and Donatello were doing the whole of their life's work. It was as early as 1403 that the two latter went to Rome for the study of the antique, measuring every column and fallen cornice so diligently that the Roman people thought they were seeking for treasure.

It is said that the factions of the Guelf and Ghibeline arose out

of the quarrel of two German nobles over the merits of some dog; if so, this dog is an important factor in the French Renaissance. This quarrel soon made Italy one continuous scene of war, in which a great part of the nobility of Europe were actors. The French king and nobles here saw this new art, and, ripe as they were for change, they doubtless desired to have it for themselves; and this is consistent, for the history of wars is the history of architecture. Let us imagine a noble quartered in some luxurious house, as the Chevalier Bayard was at this very time in Brescia, the scene of the most charming of all anecdotes of him. The spirit of the place would grow on him, and his own dark heavy-moated château would appear melancholy and prison-like in comparison. The demand created the supply, and the Renaissance had commenced in France, Tours, as we should expect, being the centre.

Late French criticism has attempted to establish the independent growth of the style in France. Be this as it may, it was well established, and the flower of the work done, before Primaticcio came to France in 1531 and Rosso in 1530. To these, however, it was the fashion a few years ago to ascribe the introduction of the style into France—Chambord, among others, being credited to Primaticcio—which, however, we know now was commenced eight years before his arrival. M. Chevalier, whose little book on Chenonceaux has been one of my chief sources of information, says that no Italian artist put foot in France until after the treaty of Cambray, 1529. In the last years of the fifteenth century there was a considerable school of painters in the capital of Touraine—Jehan Fouquet and his sons, the Clouets, &c.; and here in 1507 the cloister of St. Martin and the upper part of the north-west tower of the cathedral, by the brothers Colombe, are the first-known architectural works. Soon after came Azay le Rideau (perhaps the best work with Blois of the movement) and Chenonceaux in 1513, built by Thos. Bohier, General of Finance, who had been twice to Italy before this time, and was ultimately killed there before Milan in 1524 in the retreat of Bayard, in which the chevalier himself lost his life one month later. The conjunction of these names is suggestive of the new order and the old. Francis I. was crowned in 1515, and building in the new style became quite a fever. The principal part of Blois, Chambord, and the celebrated Château de Madrid, near Paris, now destroyed, were built by the king, and large works were undertaken by private persons, such as the Hôtel Pincé at Angers, the Hôtel Gouin, and other houses in Tours; the Maison d'Alluye, Blois; the Hôtel de Ville, Beaugency; the houses of Agnes Sorel, François I., and Diane de Poitiers, in Orleans—all these on the Loire; but the style had become general from Paris on the one hand to Caen, which perhaps is richer in work of this date of an especially beautiful type than any other town (and in the neighbourhood of which is the large château of Fontaine Henri), and Dieppe, where there is the Manoir, built by the great merchant d'Ango; and on the other hand to Dijon and Lyons, &c. Later the château of Anet was built for Diane de Poitiers by Philibert de l'Orme, and it was one of the latest buildings erected in the early style, and is now only known by a fragment in the courtyard of the Beaux-Arts in Paris. "They do these things better in France," in a later style, but much at the same time (in 1556) the same architect built the great salon at Chenonceaux, which bridges the river, also for Diane de Poitiers, who, notwithstanding her beauty and "eternal youth," was such a hard and exacting proprietress that its historian says surely this woman was "sans entrailles;" and here we shall leave France, as we only propose to consider the early variety, and already work was being done at the Louvre and other places which would not come under that category, and Jean Gougon and Bernard Palissy were doing their work—the greatest of the French Renaissance.

In England we can make no claim for the Renaissance being of native growth, but its first introduction was almost as early as in France. Torregiano, born 1470, the hero of the quarrel with Michael Angelo, was invited here in the early years of the reign of Henry VIII., and, according to Vasari, he executed here many works in "marble, bronze, and wood, and was so largely remunerated that had he not been a most violent, reckless, and ill-conducted person, he might have lived a life of ease, but being what he was, his end was the reverse of peaceful." He died in the prisons of the Inquisition, in Spain, for destroying one of his own statues, in 1522. It appears from Benvenuto Cellini that Torregiano made a visit to Italy while he was in the service of the king, and he pressed Cellini to accompany him back, but the latter did not care to come among such "barbarians." The principal work of Torregiano is the tomb of Henry VII., and was executed within four or five years of the chapel itself, and finished in 1519, for which he received the large sum of 1,000*l*. Another and very beautiful work of his, in a pure Italian manner, is the tomb in the Rolls chapel.

Holbein, born at Basle, 1497, is the next name we meet with—by far, I think, the greatest artist that has been among us, notwithstanding Rubens and Vandyck. He was invited here by the Earl of Arundel, also a name we should mention with honour. Holbein was one of the universal geniuses supreme in painting, but a great designer, as well in architecture as in silver plate and jewels. Inigo Jones had a book of designs by him, which included sword-hilts, scabbards, belts, button-hooks, hat-bands, girdles, shoe-clasps, knives and forks, salt-cellars, &c., &c.; "his mind

* A paper by Mr. W. R. Lethaby read before the June meeting of the St. George's Art Society.

was so great that nothing was too small for him." He held the post of architect to the king until his death in 1543. His principal architectural work was at Whitehall, now destroyed. He was followed by John of Padua, a somewhat shadowy personage, who is sometimes given a separate identity, and at others thought to be a Dr. John Caius, of Cambridge (who is known to have visited Padua about this time, and who designed Caius College), or John Thorpe, who we know from his MS. book of designs designed some of the buildings that are usually attributed to John of Padua, as, for instance, Longford Castle. Longleat, 1569, is also credited to him, but also to Thorpe (which is most probable from the style), and also to Sir J. Thynne, the founder. One thing is certain from the style of the buildings, either they were not designed by John of Padua, or he was not really an Italian. John Thorpe was the architect of Wollaton, 1580; Burghley, 1578; Kirby, "whereof," he says, "I lay'd the first stone, 1570;" Longford Castle, 1591; Audley-end, 1616; Lyveden, built by Sir Thomas Tresham; also probably Holland House, 1607; Longleat, as before said; Montacute, 1580; Sherborne, for Sir Walter Raleigh (we know from his book that he did work for Sir Walter); Bramshill, 1608; and Hatfield, 1611.

Other works of this time are Gorhambury, near St. Albans, built 1665 for Sir Nicholas Bacon, and so the earliest of those I have mentioned (it is but a fragment, being a porch and storey over; two medallions in spandrels of the arch are obviously inspired by antique coins; it is quite an attempt at purism with the exception of the windows, which are Tudor-headed); Hardwick Hall, 1597; Bleckling, Norfolk; Westwood, Worcester, 1590; Castle Ashby, Charlton, Kent, 1612; Bolsover, Derbyshire, 1613, and others all over the country. Sir Thos. Tresham is said to have been an amateur in architecture, but Thorpe designed Lyveden, his largest work, and there is a curious parallel between the Lodge at Rushden, his smallest work, 1595, and Longford Castle, both being designed on a triangular plan, the former, from the character of Tresham, evidently symbolic of the Trinity, and the latter also, for the symbol is drawn on the plan of Thorpe's in his book. The architect who closes this era is Inigo Jones, himself the brightest ornament of the later English school. He was born in 1572, and visited Italy between 1600 and 1605; he became architect to the King of Denmark in Copenhagen, from whence he went to Scotland as Court architect, and then visited Italy a second time. On his return to England he became surveyor to the Crown and designed Whitehall Palace in 1619, which, perhaps, for a mastery of the style, has not its equal out of Italy; and in 1633 the great portico of old St. Paul's, other works being old Somerset House, Wilton House, and St. Paul's, Covent Garden, all in the style best known as "Classic." And others, such as St. John's, Oxford, and Heriot's Hospital, Edinburgh, 1628; were in a freer and more picturesque style, the latter particularly being like German work of the Heidelberg type. Inigo Jones died in 1652.

I propose now to leave history and consider briefly the characteristics of the style in France and England. In France the early works of the Renaissance are in mass essentially Gothic. The châteaux, such as Azay and Chambord, are simply those of a generation before Chaumont and Langeais for instance, with their machicolations, steep roofs, round towers, &c., overlaid with Renaissance detail of a Florentine type, the caps being nearly all on the model of what I may call the Florentine pilaster capital. The pilasters, which are extensively used, are not fluted, but frequently ornamented with flat carving, just as in Italy; in the very early work, and especially church work, as at Caen, even Gothic details are given us under a thin disguise—corbellings, niche canopies and crockets, metal finials, &c. Everything is decidedly French, or, where the features are common with Italian work, it is just those features which we did not copy. It is this decidedly French character which makes the style unfit, I think, for us to make use of largely in our work, unless we merely take ideas translating them into English idiom, just as our best Gothic men have learnt to do with the Gothic of France. Nearly all that is fine in the style in France, I think, should be credited to what remained of the Gothic tradition. The overlay of Italian detail is profuse, cold, and heartless, affecting the mind, as is said, with a fine feeling for architectural criticism in "John Inglesant," like an uneasy conscience. This should apply more particularly to some works, such as Chambord (which seems to me excessively hollow), and to the Hôtels Pince and Gouin, at Angers and Tours respectively, and perhaps Chenonceaux. With other work, like Blois and the Caen buildings, there seems a truer ring, especially the building called the Cour des Monnaies. There appears to me generally rather actual sublimity of size with no "largeness" in the idea than what there should be in good architecture—frequently small dimensions, but always largeness in the design.

The English work was not so much an overlay of Italian detail on an earlier style, but more of a radical change with squareness and symmetry in the composition, and nearly always an order with some approximation to a well-defined variety, Doric, Ionic, or Corinthian, regular entablatures, with triglyphs, and frequently an attempt at figure sculpture—for instance, the nine worthies at Montacute. Other features are found common in Italy, and others almost particular to Germany and the north-west of Europe, such as the obelisk form used as a pinnacle, rustication, &c., of the

former, and strap work, quaint arabesques, curved gables, nondescript animal and human forms, and swags of fruit of the latter. But we can hardly find a detail of similar style used both in French and English work.

During the time of the Reformation we were much in communication with the Dutch and Germans, and cut off from France. Many works were actually commissioned abroad. Sir T. Gresham, who erected the first Royal Exchange, is said "to have bargained for the whole mould and substance of his workmanship in Flanders." And there is hardly a doubt that many of the tombs of this age were obtained in a similar way, from their almost identical character with Flemish and Dutch work. All this went to mould the character of our English Renaissance, and possibly Inigo Jones's residence in Copenhagen contributed to the same direction.

It appears to me, therefore, that we have two traditional Renaissance styles. The one, which I will call the Classic, is derived, through Inigo Jones, from a study of the Roman school of Bramante and Michael Angelo, and for further knowledge of which we must go to their works and to that which inspired them—the antique. To this school belonged Wren, Hawksmoor, and Gibbs. It is essentially the London style. The other is what has been called the Elizabethan, and is closely allied to Dutch and German work, much of which might, without any violence to our own national traditions, be embodied in English work.

I fear that I have taken up your time mostly with a bare statement of dates and dry particulars, when my views might have been summed up in the few words that, while keeping ourselves open to all new ideas to be gathered from French or any other styles, we should work in our own traditions, inclining as much as may be to purism, but admitting the truth of Bacon in the "Essay on Beauty," when he says there is no exquisite beauty without some strangeness in its proportion.

TREASURE-TROVE IN ROME.

AT ten o'clock on the morning of the 21st inst., says a correspondent of the *Scotsman*, archæology made a precious acquisition. At the end of the Via S. Ignazio, not many paces from the little back door leading out of the church of Santa Maria sopra Minerva, an excavation, some 9 feet deep, has been effected. A few days ago an Egyptian sphinx of black basalt came to light, and yesterday morning, in extending the cavity, the pick glanced off a resisting mass which turned out to be granite. With the utmost caution the excavators proceeded further, and alighted on part of an obelisk, sculptured in red granite, with hieroglyphic legends on its four façades. The part just exposed is the base, and it is hoped that the monolith may emerge entire, or that, if broken, the fragments may be found in the immediate vicinity. The obelisk, to judge from its proportions hitherto brought to light, seems to resemble that which rests on the back of an elephant in the Piazza della Minerva, and the disinterment of it cannot be difficult, as its calculated length will scarcely touch with its apex the wall of the sacristy of the church. The Archæological Commission, as soon as the discovery was made, lost no time in communicating it to the Syndic, and accordingly, at noon, that dignitary (the Duke Leopoldo Torlonia) was on the spot, together with the assessor Tenerani. Both these connoisseurs congratulate the Commission on the treasure-trove.

The area near the church teems with Egyptian antiquities belonging to the old Temple of Isis and Serapis. A few days ago, when the excavations were begun, a sphinx of black basalt, in excellent preservation, was, as I have said, found there, and is now in the courtyard of the Muses Capitolina. The proprietor of the little house No. 28, hard by, has discovered other sphinxes, one of which he has sold to Baron Baracco, while another stands in an open space of his tenement, where there is also to be seen a fragment of a column, thick at the centre and tapering off at the extremities, with historic legends around it. The figures on it in bas-relief represent Egyptian priests, their vesture of the finest execution, their heads tonsured, and wearing crowns. In their hands they hold the emblems of their worship.

The Archæological Commission is now considering the propriety of purchasing the objects unearthed, and of prosecuting the excavations. Readers may remember that the obelisk mounted, by a whim of Bernini's, on the back of an elephant in the Piazza della Minerva was found in 1665, in the garden of the Dominican fraternity attached to the church, and that it, too, came from the Temple of Isis. From the same source comes the obelisk in front of the Pantheon, which, at the instance of Clement XI., was erected as the centre piece of the fountain in the piazza.

The obelisk just exhumed from the site of the Temple of Isis and Serapis has been found to bear the name of Pharaoh Rameses II. of the nineteenth Theban dynasty. It belongs to the fourteenth century before Christ; but the question arises whether it is an original Egyptian work or a replica made in Roman times. Signor Lanciani, who superintends the excavations on the above site, announces that the sphinx in black basalt lately disinterred, and now placed in the Capitol, represents Pharaoh Amasis, the last but one of the Saitic dynasty.

NOTES AND COMMENTS.

A BILL has been introduced in the House of Commons which proposes to make it compulsory on all constructors of public buildings that doors should be hung so as to open outwards. Every person who wilfully causes any door to be hung in a contrary way is to be liable to a penalty not exceeding 20*l*. With regard to doors which have been hung both before and after the passing of the Act, which do not open outwards, a court of summary jurisdiction may require an occupier to alter his door, and if he neglects or refuses to make the alteration, the court may authorise and empower the local authority to have the door altered. But in the case of doors which date from before the passing of the Act, the expenses are to be paid out of the local rates. The owner or occupier of a public building may cause any entrance doors in such building to open outwards, anything in an Act of Parliament, or in by-laws to the contrary notwithstanding. It will be seen that the Public Buildings Doors Bill is somewhat revolutionary in character, and it is surprising that Mr. BERESFORD HOPE, who is the first authority on architecture in the House of Commons, should back such a scheme. There are many buildings where the steps are close to the door, and in a panic there would be danger if the doors opened in the way proposed.

A MEETING was held at Marlborough House on Monday, under the presidency of H.R.H. the Prince of WALES, for the purpose of considering the project for establishing a British School of Archæology and Classical Studies at Athens. The following resolutions were adopted: 1. That it is desirable to found a British School of Archæological and Classical Studies at Athens. 2. That the object of the school should be to promote all researches and studies which can advance the knowledge of Hellenic history, literature, and art, from the earliest age to the present day. 3. That the school should occupy a house at Athens, containing a library, under the care of a resident director. 4. That membership of the school should be open to any person accredited by a university or college of the United Kingdom, or by the authorities of the British Museum or of the Royal Academy; that no payment should be required from members; and that, on the other hand, the school should not provide lodging for them, nor defray any part of their personal expenses. 5. That it should be among the duties of the director (1) to aid members with information and advice in the prosecution of their studies; (2) to transmit periodically to a committee in England reports on researches made under the auspices of the school, or on other subjects of interest in relation to its work. 6. That an endeavour should be made to raise by public subscription a sum sufficient for the establishment of a school on the plan indicated above. 7. That a committee for that purpose be formed, with power to add to their number.

THE committee of the Manchester Art Museum have already collected some valuable works for students. Among them are several beautiful water-colour drawings of common flowers made by Mrs. ALLINGHAM and Miss E. GERTRUDE THOMSON, a series of about 170 excellent water-colour drawings of wild flowers by Miss E. REDGRAVE, and twelve or fourteen of common wild birds by KEULEMANS. The committee have also the stones for a large lithograph of a beech, of great beauty and fidelity to nature, and for a series of lithographs (which after they are printed are coloured by hand) of the foliage of the commonest kinds of English trees. All these stones have been prepared by Mr. W. WALKER, and the impressions from them are considered by the committee to be the best representations of foliage which have appeared. Lithographs by Mr. WALKER of eleven other trees besides the beech will soon be completed.

It is generally accepted that a contractor's plant, in case of his failure, becomes—for a time at least—the property of the employer, and it is usual to have a clause in the conditions to this effect. But when there is a sub-contractor, will the clause hold good? From a decision which was given by Mr. Justice PEARSON, it would appear that sub-contractors are outside the clause. In the case referred to, there was a contract for railway works, which provided—"That all materials, horses,

engines, tools, implements, and plant left by or by order of the contractor upon the works should be the property of the company for the use of the company, and not removable without the consent of the company's engineers; that all materials or plant provided for the works should remain the absolute property of the company, and such portions as should be approved by the engineers might be used on or for the purposes of the said works." All the works would appear to have been sublet; and when the original contractor failed the sub-contractor claimed to be entitled to remove his plant. The company accordingly applied for an injunction to restrain him. The Judge, however, was of opinion that the contract was with the contractor, and he declared the claim on the sub-contractor to be manifestly inequitable. It will, therefore, be prudent in buildings to have no interference with the property of the sub-contractor.

At a late meeting of the Académie de Médecine a resolution was unanimously passed urging upon the authorities of the City of Paris to complete as speedily as possible the sewer system of the capital. It was further decided to appoint a committee of members to study and report to the Academy upon the many rival methods of emptying the cesspools, and upon the subject of sewerage generally. It may be remarked that in the list of works lately submitted to the Municipal Council for approval, the amount put down for the completion of the drainage and water systems came to over 90,000,000 frs.

It has been long supposed that CHAUCER was connected with Woodstock, and occupied a house on the borders of the park. The rector proposes to erect a window in the church as a memorial of the poet. But a correspondent of the *Times* maintains that the connection between CHAUCER and Woodstock is the merest legend, based on no historical foundation whatever. Out of two or three allusions to Woodstock in his poems, and out of a local tradition, GODWIN, the most unscrupulous of romancers, constructed an elaborate story of CHAUCER's having lived in the park; and since GODWIN's day this story has been accepted without question by the uncritical public, and even by such a distinguished writer as Mr. LONGFELLOW. It has, however, been conclusively shown by Sir HARRIS NICOLAS, Mr. FURNIVALL, and others that the house in question was granted by HENRY IV., ten years after the poet's death, to THOMAS CHAUCER, afterwards Speaker of the House of Commons, generally, but without evidence, assumed to have been the poet's son.

THE utility of telegraphic and telephonic wires is not to be questioned, but it must be admitted that they do not improve the aspect of our streets, and it is supposed they are more or less dangerous. But how are they to be removed? The local authorities have been advised that they must seek first the authority of a court of law. The President of the Local Government Board has been interviewed by a representative deputation, and his reply suggests the difficulty of the case. Sir CHARLES DILKE says the view which the Government took of the matter was that the owners of these wires, having no greater rights of interfering with streets than had any ordinary member of the public, could not, either with or without the assent of the local authorities, interfere with public highways in such a way as to cause obstruction to the public, even though such obstruction were limited to the time during which they were executing their works. He did not know that the Government were prepared to say that it would in all cases be unlawful to carry wires over houses with the consent of their owners, but it would be a question of fact in such a case whether wires so suspended were such a probable source of damage or danger to people going along the highway as would constitute a nuisance, and that, of course, would depend upon a variety of considerations connected with each particular case. The question in the matter was whether, in view of the great risks attending these wires, there was power in the local authorities to interfere; and if there were no such power, he agreed with the deputation that control should be vested in them. But the Government thought the authorities had this power; and until it was proved that they had not, he would not care to undertake legislation in face of the opposition with which such a scheme would be met. It accordingly becomes the duty of some of the vestries to have a test case tried.

WILLIAM H THORP, A.R.I.B.A. ARCHITECT

The Architect June 30th 1883.

DESIGN FOR ALL SAINTS CHURCH, IPSWICH.

By A.W. BREWILL, ARCHITECT

ILLUSTRATIONS.

PRIZE DESIGN FOR SILVER SALAD-BOWL.

THE Goldsmiths' Company instituted a competition last year, and the first prize, amounting to 100*l.*, was awarded to the design by Mr. W. R. LETHABY, which is reproduced in the illustration.

NEW PREMISES, WHITBY.

THE illustration of carving is from work executed at the above buildings, which have just been completed, and is occupied by the National Provincial Bank of England (Limited). There is also a shop and offices on upper floors. The building is erected with brick facings and stone dressings, and is fire-proof throughout, and is situated in Baxtergate. The architects were Messrs. PERKIN & BULMER, of Leeds, and the builder Mr. JOHN WHITE, of Whitby.

SEMI-DETACHED VILLAS, BROMFIELD CRESCENT, HEADINGLEY.

THESE houses are situated in a pleasant part of Headingley, which is the favourite residential suburb in the locality of Leeds. As regards accommodation, the ground-floor of each house comprises good-sized drawing and dining-rooms, each with bay windows; well-lighted entrance halls, opening upon wooden verandahs; kitchen, pantry, and scullery; on first floor are three good bedrooms, a bathroom, and other necessary accommodation; on second floor are two additional bedrooms. The basement contains coal-place and larder.

In these houses an attempt has been made to produce conveniently-planned and well-arranged habitations, combined with a pleasing and picturesque exterior, without involving a large outlay of money. The materials used are brick of a deep red colour for facings, red terra-cotta from Messrs. WILCOCK & Co., of Burmantofts, for moulded strings, sills, &c., and a very sparing use of stone from the Harehills Quarries. The front gables are constructed of timber in solid scantlings, well framed, and pinned together with oak pegs, filled in and well backed behind with brickwork; the panels faced with cement, which, together with the cored cornice, are finished in vellum colour. The whole of the woodwork of exterior is painted a neutral shade of peacock-blue, forming an admirable contrast with the deep red of the bricks, the sashes and casements only being finished in cream colour. The whole of the chimneypieces in the interior are carried out from the architect's special design; those in the drawing-rooms being of mahogany, finished in rosewood colour, and those in dining-rooms of oak, stained with ammonia and dull wax polished.

The houses, with outbuildings and boundary walls, which have been erected for Mr. JOHN HALL THORP, of Bromfield, Headingley, have cost 1,450*l.*, or thereabouts, this amount not including the price of land. They have been carried out from the designs and under the superintendence of Mr. WILLIAM H. THORP, A.R.I.B.A., architect, of St. Andrew's Chambers, Park Row, Leeds.

OLD HOUSE, HEREFORD.

THIS illustration has been reproduced from a water-colour drawing by Mr. R. K. FREEMAN. The subject is the interesting old house in Hereford which has lately been converted into a bank, and therefore is likely to be preserved in its restored form for a good many years.

ROMAN CATHOLIC PRESEBYTERY, WINDSOR.

THIS building, which we illustrate, now approaching completion, is from the designs of Mr. P. J. BYRNE, A.R.I.B.A., and Mr. J. WILMOT, of 303 Strand, and Windsor. It is of a simple Gothic character, carried out in red pressed bricks, black mortar pointed, with Bath stone dressings, and a sparing use of WILCOCK's Burmantofts ware in panels. The internal woodwork is intended to be in pitch pine, stained and varnished. The porch will have some carved work on the arch, with Irish polished green marble shafts and foliated capitals. All the hearths, floors to vestibule, covered way, and bath are to have MINTON-HOLLINS glazed figured tiles. The chimneypieces are to be in American walnut. Messrs. A. L. OADES & SONS are the contractors, whose tender of 1,450*l.* was accepted for the work.

DESIGN FOR THE PROPOSED NEW CHURCH OF ALL SAINTS, IPSWICH.

THIS is one of the designs sent in for the above competition by Mr. ARTHUR W. BREWILL, architect, Nottingham. The author's aim was to design a simple and dignified exterior at a reasonable outlay. It was proposed to erect the lower part of the church first, and the tower and spire at a later date. The estimated cost of the church (to seat eight hundred) was 5,600*l.*, that is, exclusive of the benching. The church contains about 369,000 cubic feet, that is, allowing from six feet below the floor-line to half the height of the roof.

THE TOWER OF LONDON.

LONDON is slowly awakening, says the *Times*, to see that it is not only the biggest and the richest city in the world, but in many ways the grandest and the most historic. Rome has her ruins; Paris has her boulevards, palaces, and quays; Moscow has her Kremlin; and Constantinople her minarets and domes. Each of these, and, perhaps, some famous cities in Italy or Spain, are superior to London in the single element of beauty, of magnificence, or age. But the greatness of London lies in its historic continuity, in the survival of its true organic centres in all their essential character. It possesses in the Abbey, in Westminster Hall, and in the Tower, three of the noblest buildings in the world; all of them have an unbroken history of eight centuries, all are still devoted to the uses for which they were designed, and for 800 years they have all been the local seats of our national existence. These three great monuments are bound up with each other as well as bound up with the history of England. As cathedral, hall, and castle, no one of them has any superior in Europe. But, in the way that they are inwoven with the greatness, the genius, the poetry, the destinies of the country, as also in length and continuity of service, no one of them has its equal in Europe. The city which possesses all three has at once a dignity of her own; nor need we think of St. Paul's and the Temple, the Guildhall and the Palace of Westminster, the parks, the bridges, and the docks, to believe that we are truly citizens of no mean city. Neither mud nor smoke nor stucco, neither vestries nor railways, can make London mean. For in the mass, in the antiquity, in the historic splendour of her national monuments, in the halo which the heroism, the crimes, and the imagination of eight centuries have shed over them, London remains to the thoughtful spirit the most venerable city of the modern world.

And now, it seems, London has an *Ædile*. We have now a Minister of the Crown who conceives it to be a real part of his duty to preserve, cherish, and open to the public our great public monuments. It belongs to our national habits that an English Minister of Public Works should regard his office as a sort of society for the preservation of ancient buildings rather than as a syndicate for the destruction and transformation of ancient cities, which is the fixed idea of the Continental Haussmann. These Attilas and Genghis Khans of modern society, with the aid of the railway and building companies who form their natural allies, are rapidly achieving the Haussmannisation, not only of Paris, but of Rome, Vienna, Milan, Florence, and every mediæval city of Europe. It is a comfort to think that, while prefects, mayors, and town councils everywhere on the Continent are seeking to make their cities a fair imitation of New York, our First Commissioner of Works is occupied in preserving to us our ancient monuments in the form in which they were built. And it is not a little curious that at the present moment he is busy about the preservation of all three of our great monuments. He has just revealed to us what Westminster Hall was in the days of the Normans. He has still before him the cruel problem of refacing the Abbey. And now he is showing us the Tower—not, alas! as it was when it still served the Tudor kings as a palace, but freed from the eyesore with which the stupid vandalism of the last hundred years had loaded it.

The Tower is the oldest of the three great monuments of London, and assuredly it stands at the head of all buildings of its order in the world. It is the most perfect extant example of a feudal castle of the first class, continuously used as a fortress by the same dynasty, and as a seat of the same Government, since the times of the Crusades. It is, in fact, the civil building in the world which can show the longest and most splendid history. The Pantheon at Rome, a few of the great Basilicas, the Byzantine Church of the Holy Wisdom, and a few religious buildings on the Continent can show a longer life; but there is no civic building, being neither a ruin nor a restored ruin, but still a great seat of government, which can show so vast a record. The Tower of London has entered upon the ninth century of its continuous life in the service of the English Crown. When the White Tower first rose beside the Thames, as the buttress and symbol of the Conquest, the nations we call France, Germany, and Spain did not exist. It had already seen centuries of great and memorable things before the oldest of the palaces and halls of Europe had their foundations laid. Men talk of the traditions of the Kremlin, the Vatican, and the Escorial; but the first half of the wild history of

the Tower was over before a stone was laid of these vast piles. The races who raised the fantastic domes of Moscow or the minarets of Constantinople were wandering herdsmen and robber tribes in Asia when the Tower was the home of the most powerful kings in Europe. The old Palaces of State of Venice, Florence, Ghent, and Bruges have traditions of great antiquity, and are memorable sources of art, romance, and poetry. But their real life has closed for ages; they are little now but monuments or museums. The Tower which began so long before them, has outlived them all in permanent vitality. The descendant of the Conqueror is still mistress of the White Tower, which for eight hundred years has guarded the symbols of our national power. It is true that in point of picturesque beauty the Tower must yield to some of its younger rivals. It has not the mountain-like grandeur of the Palace of the Popes at Avignon, nor the fairy beauty of the Doge's Palace at Venice, nor the sky line of the Old Palace at Florence, or of the Castle at Prague; much less has it the weird impressiveness of that skeleton of castles, the upper city of Carcassonne, or the piles of Loches, Chinon, and Angers. The glory of the Tower of London lies in its matchless historical record. Carcassonne has been a ruin now for six centuries; the civic palaces of Italy, Germany, and the Netherlands had a history at most for a few hundred years; and Avignon records but an episode in the career of the Papacy, seventy years of servility, ferocity, and vice. The building of all others which in historic dignity approaches most nearly the Tower is that fragment of the great palace of the Capetian kings beside the Seine, which now survives under the name of the Conciergerie, of which the Palais de Justice is the transformed Court of Justice, and of which the Sainte Chapelle of St. Louis was the proper chapel. Behind that screen of brand-new Gothic restorations with which the Viollets-le-Duc have everywhere enveloped the ancient monuments of France, Parisians, if they only knew it, might still find the fortress of their ancient monarchy worthy to compete in historical importance with the Tower of London itself.

We are far too apt to think of the Tower as a mere prison, and to dwell too long upon its bloody memories. Prison it is, far the most memorable in the world, or at least second only to the Mamertime Prison by the Capitol. But it is not a whit more prison than it is fortress, or palace, or seat of government, or court of judgment and court of record. It is a prison by accident, or by consequence; not that it was built as a prison, or ever destined to be a prison; but because all Governments seek to have prisoners of State in the most central and secure seat of their power. The Tower is not more bloody than the Crown of England, or the history of England. It has been the home of some of our greatest rulers, the scene of some of the wisest councils, the treasure-house of the most precious things, and the subject of some of the noblest poetry in our language. The Tower has really a fourfold character and a fourfold history. It is palace, fortress, treasure-house, and seat of government; it is only prison as part of the functions of a fortress. Perhaps the reason why we Londoners usually regard the Tower as a prison is that too many of us visit it as children, or in company with children, and then the tales about racks, martyrs, the young Princes, and the Traitor's Gate, form the natural staple of the talk.

The antiquity and historical interest of the Tower belong to it far more as the seat of Government of Norman and Plantagenet kings than from its traditions as a Tudor prison-house. From the sons of the Conqueror down to Elizabeth—that is, for a period of nearly five centuries—it was from time to time the residence of nearly all of our kings, and consequently the scene of our political history. Without saying that it would be possible to prove it to have been the permanent home of all of those sovereigns, most of whom were in perpetual movement, it was certainly the usual London residence of several, and was occasionally used by all. The Henrys and the Edwards of Plantagenet all inhabited it. From Henry IV. down to James II. the kings left it in state to be crowned in the Abbey. Here two of our kings, four of our queens, and many princes and princesses of the blood met their deaths. Many of the children of the sovereigns were born there. The abdication of Richard II. and the outburst of Richard of Gloucester most certainly took place here, and these are but two of the scenes immortalised in Shakespeare. The Tower seems, indeed, in a peculiar way to have touched the imagination of our great poet, and there is certainly no edifice remaining in which so many of his scenes are placed. Thus the Tower has the halo of poetry around it as much as of history. For no extant building whatever is so much associated as this with the thoughts of any of the great poets of the world.

To put aside the whole of the executions which have soaked with blood both Tower Hill and the green by St. Peter's, there is in the traditions of the Tower, in Norman and Plantagenet times alone, enough to make it a relic of perfectly unique importance. As its history begins long before that of Windsor, Whitehall, or St. James's, and as all vestiges of the older palaces are gone, except perhaps the crypt of St. Stephen's, it is by far the most memorable survival of Feudalism, either in this country or any other. The long series of wars in which England conquered Wales, Ireland, Scotland, and twice crushed France, all rested on this fortress as their central headquarters; and from 1244 for two centuries it was filled by a long succession of royal prisoners,

Welsh, Scotch, French. The Scotch princes of the wars of Edward I. and Edward III., and the French princes of the wars of Edward III. and Henry V. lived here for years in captivity, the most illustrious of whom was the poet Duke of Orleans, the prisoner of Agincourt. During the civil wars of the fifteenth century it played a larger and more continuous part than any remaining castle, and in Beauchamp Tower and Wakefield Tower it still retains names which recall the Roses. There is thus no extant building in Europe which has so long a roll of memories of the feudal world from the opening of the Crusades until the final settlement of the modern monarchies in the West.

From another point of view also, which has nothing to do with axes or dungeons, the Tower has a value which places it almost alone. It is, if not the grandest, at any rate the most perfect extant example of a feudal castle of the first class, with its three complete series of defences, all in working condition. Though it has not the imposing mass of Carcassonne, Loches, or Windsor; though in antiquarian details it must yield to Pierrefonds, Langeais, Avignon, Villeneuve, Raby, Berkeley, and some others in England and France, the Tower is neither a ruin, nor a restored ruin, nor a modernised palace; it is not a mere baron's stronghold, but a national fortress of the first class, still fit, after a few weeks of labour, to stand a siege against lances, javelins, and bows and arrows. It is said that the portcullis in Bloody Gate is the only example remaining of an ancient portcullis still in working order. Be this as it may, it is certain that the Tower is the only specimen in England of a mediæval fortress of the first rank which has never been destroyed and has never been "restored." It has been continuously kept as a fortress from the days of Gundulph, the mitred engineer, in 1078, until the days of Mr. Shaw-Lefevre, the First Commissioner, in 1883. Of its twenty-seven original towers and works, some twenty at least remain; it is the palace and residences which have suffered most; the principal points of defence remain and are structurally almost uninjured. A little study, and some assistance from old plans, views, and surveys, would enable even a holiday sightseer to gain a clear conception of the way in which Plantagenet kings hedged themselves round from their too-loving subjects; to find the uses of the old "Lyons Gate," the moat, the bridge with its double *tête-de-pont*, the outer ward and its bastions, the inner ward and its towers, the belfry and the Light Tower, the Water Gate, the Garden Tower, the Hall, the Iron Gate, and the great Donjon of the Conqueror, or, as poetry and tradition with characteristic instinct will have it, the Tower of Cæsar or of Empire.

The two churches of the Tower are each of them worth a visit to London by themselves. St. John's, the original work of the Conqueror, still remains one of the most complete specimens of pure and early Norman work. This church has, perhaps, witnessed more of English history than any other church in England, unless perchance it be the Abbey, or St. George's at Windsor. St. Peter's-on-the-Green, if less valuable in the history of art, is, if possible, even more precious in the history of England. No spot in our island, hardly the choir of the Abbey itself, has such power to touch the heart as the quiet church under the floor of which lie the bones of hundreds of men and women great, proud, beautiful, and daring—noble victims of tyranny, and reckless victims of their own passion, during the centuries of civil strife, conspiracy, and war that went to the making of our English State.

A complete record of the State prisoners of the Tower would be nearly an outline of the history of England. It is sad to think how small a part even of these prisons is yet open to the public. The sightseer is taken to the Armoury and the Jewel House, the White Tower and the Beauchamp Tower, the Green and St. Peter's, and then he is assured that he has seen the Tower; and he talks for an hour of Anne Boleyn, Raleigh, and the princes. But how few of them can see the portcullis apparatus, and the passage and rooms over Bloody Gate, and the prisons of Elizabeth, of Raleigh, of Arabella Stuart, of Fisher of Rochester, and of the Seven Bishops, of the Earl of Essex, and Lady Jane Grey! And even the curious have not seen all the vaulted chambers with their chimneys and embrasures in Byward and Bowyer Towers, and the Roman remains by the old "Queen's Lodgings."

Truth to say, the fact that the Tower is still, after eight centuries, a working engine of the British Government, though an historical fact without a parallel in modern history, is rather a bar to its use as a mere national monument. The Tower is not, like the Louvre or the Doge's Palace, a museum and a show. It is still a great barrack and military dépôt. It is still the great treasure-house of the Crown jewels. It was till lately the Mint and the Record House; and it still serves as a residence for many families by the favour of the Crown. It may well be that the time has come when this matchless monument of our national history should be protected from accidents and from that constant injury and modernising process which follow from using it for purposes of residence. These towers, every stone of which is a memory, ought not to be exposed to the daily risk of fire and the wear and tear of daily use. It makes one shudder to see a brisk housemaid rattling her pans about the embrasure where Raleigh pondered on the History of the World, or where More thought how little this world is a Utopia. A lover of the past who is tracing out the

letters cut by some prisoner of the battles of the Roses has to jostle a scullery-maid cleaning her dishes. The Tower is the priceless possession of the English people, and no question of providing comfortable, or rather uncomfortable, quarters for a few excellent veterans ought to stand in the way of its being carefully protected and fully shown to the public. An adequate force to protect the jewels and to give dignity and life to the noble old pile is all that is needed. But all the inmates of the fortress should be lodged in the modern buildings, and none should be suffered to crowd and deface the original towers. The White Tower should be cleared of the senseless and cumbrous display of modern weapons, and uncovered to our eyes as the Chapel of St. John's now is. If barracks and ordnance storehouses are required they should be found elsewhere. The First Commissioner has done much, but he has much to do. He has entirely to clear and to protect the grandest feudal relic left in Europe. The towers of Julius would, indeed, be "London's lasting shame" if our indifference or our parsimony were to lead to their destruction, or were to continue to leave some of their most venerable chambers degraded and blocked up by the ignoble uses of a common lodging.

THE LAW COURTS CONTRACT.

ON Tuesday, in the Queen's Bench Division, an appeal was heard in the action taken by the assignees of Messrs. Bull, the contractors for the erection of the Royal Courts of Justice, against the Commissioners of Works to recover the sum of 10,000*l.* alleged to be due and payable, and so clearly so as to justify a summary proceeding to recover it, provided under the Judicature Act, for the recovery of claims undoubtedly due and against which there can be no available defence. Such a proceeding had accordingly been taken, and the sole question at this stage of the case was not whether there is a valid defence to it, but whether the Commissioners ought to be allowed to defend. The writ of summons was endorsed with a claim of 10,000*l.*, as "being the retention-moneys" in the hands of the defendants in respect of the contract, dated February 7, 1874, made between Messrs. Bull, the contractors, and the Commissioners, of the other part, for building the Royal Courts of Justice, of which moneys the plaintiffs are assignees, under a deed of June 1877 (notice of which has been given to the Commissioners), and which 10,000*l.* were due and payable, as to 5,000*l.* thereof, on January 11, 1883, and as to the remaining 5,000*l.* thereof on April 11, 1883, and for interest on those sums from the times when they respectively became due and payable. The application for summary judgment was made on an affidavit of the plaintiffs and the contractors referring to the contract, and stating that the firm "had duly completed the contract," and that the retentions provided to be made by clause 19 of the general conditions forming part of the contract were made, and the sums of 10,000*l.* and 5,000*l.* referred to in that clause were duly accumulated as the retention-moneys in respect of the work previously to June 18, 1877, and being then in the hands of the Commissioners, the date of the deed of assignment. The affidavit further stated that the works included in the specification No. 2 were completed about February 7, 1879, within the time limited, and possession thereof was duly delivered, and the sum of 5,000*l.* retained in respect of the works included in the specification, was duly paid by the Commissioners to the plaintiffs. That the works included in the specification No. 1 were duly completed, in accordance with the contract, on October 11, 1882, and upon that date possession was formally delivered, under the conditions of the contract, to the Commissioners, and on the same date the architect gave his certificate that the builders had duly completed to his satisfaction the contract of February 7, 1874, and that possession had that day been given accordingly. And, further, that the architect had, by writing, certified, under clause 19, on January 11 last (six months after completion), that the building was in a satisfactory state. But that, though application had been made to the Commissioners for payment of the sum of 10,000*l.* retained by the Commissioners in respect of the work under specification No. 1, payment was refused. To this there was an affidavit of Mr. Mitford, Secretary of the Board, stating that he was advised and believed that the Commissioners have a good defence to the action, and that they had already paid to the contractors not only the 10,000*l.* now claimed, but a sum largely in excess thereof, which sums the Commissioners were entitled to set off; that he denied that the works had been completed within the times limited in the contract, for that those comprised in specification No. 2 should have been completed on August 7, 1877, and those in specification No. 1 on August 7, 1880; and that the Commissioners were entitled to penalties largely in excess of the plaintiffs' claim, and which penalties the Commissioners were entitled, they conceived, to set off; and, finally, that on January 6 last the contractor, Edward Charles Bull, filed his petition for liquidation. In reply to this there was an affidavit of the contractor, stating that no payments had been made to him under the contract, except upon certificates of the architect certifying for payments for work done, and that no such certificate included or purported to include any portion of the 10,000*l.* retention money

claimed in this action; that the last of such certificates was for 2,000*l.*, and was given on October 11 last (on the date of giving up possession to the Commissioners), and that payment of that sum was made by the Commissioners; that, as to penalties, the Commissioners were not entitled to claim any and had never claimed them, and, on the contrary, had paid to the contractors, upon the architect's certificates, sums amounting to 43,000*l.* between August 7, 1880, and October 13, 1882, without raising any question as to penalties; that, by reason of strikes and other causes within the contract, the time fixed by the third clause for completion of the works within specification No. 1 had not expired on October 11 last, when possession was given to the Commissioners; and that the Commissioners had been told so and had not dissented; and that even if the time had not thus been extended delay had been caused by the architects not having delivered until long after August 7, 1880, a large portion of the detailed drawings, &c. That, in addition, there were certain works, forming part of the contract, the necessary instructions for which had not been given to the contractors by the architects even up to October 11 last, and that, to avoid further delay, an arrangement was made that these works should be treated as omitted from the contract and left to be completed afterwards, so that the certificate of completion might be given and possession delivered to the Commissioners, leaving the omitted works to be done afterwards. That the contractors had for many months previous to delivery of possession been in communication with the Commissioners, with reference to a large claim of the firm for extras over and above the 10,000*l.* "retention moneys," and throughout that correspondence the Commissioners had never set up a claim to penalties; and that on April 24 last, in answer to the plaintiffs' claim for the 10,000*l.*, the secretary wrote in these terms (raising none of the defences set up by affidavit)—"That the Board are not prepared to make any further payment on account of the contract for the erection of the Royal Courts of Justice until they shall have before them the claims made on behalf of the contractors;" and in conclusion Mr. Bull stated that he believed there was no defence to the action, and that the defence thereto was made merely for the purpose of delay. On these affidavits, an application having been made to a Master on behalf of the Commissioners for leave to defend the action, he gave such leave, and a Judge at Chambers had affirmed his order. This was an appeal by the plaintiffs from that decision.

On the case being called on and its nature shortly stated by the plaintiffs' junior counsel,

The Court referred to and read the affidavits.

The plaintiffs' counsel pointed out that the claim was not for work done, but for "retention moneys," as they were called—that is, moneys certificated due but retained under the contract until its ultimate completion.

Lord Coleridge pointed out, however, that, upon Mr. Mitford's affidavit, it appeared that sums of money had already been paid to the contractors "largely in excess" of the sums due to them under the contract, and that sums were owing for penalties; so that it was insane, if that were so, to set up that sums were due for "retention moneys."

The plaintiffs' counsel urged that this was yet to be decided.

Lord Coleridge observed that this showed that there was a question to be decided, and therefore that the Commissioners should be let in to defend. It did not appear to be disputed that sums were due for "retention moneys," but counterclaims were set up, payments in excess, and also claims for penalties.

Mr. Moulton, for the plaintiffs, urged that these were quite collateral to the present claim for "retention moneys." The cross claims afforded no answer to this claim, as the sums paid had been certified to be paid; this was an independent claim.

Mr. Justice Denman observed that surely when an action was brought for the moneys claimed, it could be shown that on a balance of accounts nothing was due.

Mr. Hardy for the defendants pointed out that by the contract the certificates given were not to bind the Commissioners except as to mere amounts, and were to be no estoppels on a final balance of accounts.

Mr. Moulton said the "final balance of account" was to be referred to arbitration. The sums paid were specific sums to be paid upon certificates. The present was in itself a separate and specific sum, due and payable now, leaving the "final balance" to be determined hereafter. There were enormous claims for extras which would have to be gone into on the general account. The present claim was for a specific sum now due. The other would be a claim on a general balance of the accounts, left to be determined on arbitration. As to the claim for penalties, there was nothing in it, as it had never been set up before, and was not real or substantial. The affidavit of Mr. Mitford, the secretary, was, he submitted, entirely answered by the affidavit of Mr. Bull, the contractor, in reply. The sum claimed was now due and payable; the counterclaim was future and contingent, and afforded, therefore, no answer to the action.

Mr. Hardy said notice had been given of recourse to arbitration as to the general balance, and he pointed out that the contract provided for it.

Lord Coleridge said it was not necessary to hear counsel further

for the Commissioners. It was clear there was a question to be decided and a defence to be raised, and therefore the Judge's order was quite right, and this appeal must be dismissed, with costs.

OLD HOUSES IN LEITH.

AN improvement scheme is now being carried out in Leith, and a large area will shortly be cleared. In the part which is in progress, eighty-one dwelling-houses have been scheduled. As some of the relics of Old Leith will disappear with the demolition of the buildings included in the improvement scheme, *The Scotsman* gives the following note of the more prominent:—

Between Junction Street and Yardheads, a space is being rapidly cleared in St. Anthony's Street and Lane, which marks the site of the Preceptory of St. Anthony, founded in 1435, by Logan of Restalrig. For many years a large and substantially-built stone building, occupied by Messrs. Callander & Sons as a tannery, has covered most of the ground, but a small portion of the preceptory could be seen up to a few weeks ago. This consisted simply of two or three small rooms and a quaint doorway, which sufficiently testified to the date of their erection. Some twenty years ago, the rooms were occupied as a Sabbath school. Dr. Robertson, in his antiquities of Leith, states that in a charter granted by King James is mentioned: "All the croft of arable land contiguous to St. Anthony's Garden, and also all that place and piece of ground whereon the Church and Preceptory of St. Anthony of the Knight Templars stood." In 1563, Sir James Sandilands, the last preceptor of the Order who embraced the reformed faith, resigned his possessions to the Crown. He sat in the Scottish Parliament under the title of Lord St. John. It is probable that in the struggles after the Reformation connected with the suppression of monastic institutions, the Preceptory of St. Anthony in Leith was lost sight of, as it is not till the time of James VI. that we find "the vestry of Leith, after the Reformation, having purchased the lands and properties of divers religious foundations in Leith and Newhaven, King James VI. granted and confirmed the same by charter in 1614 for the use of the poor." Even in its very early days, Leith appears to have been a wine port, as one of the privileges of the soldier monks was "an English gallon of wine out of every tun imported." Dr. Robertson says that this perquisite was afterwards exacted in the shape of a money commutation by the Kirk Session of South Leith, and subsequently formed part of the monthly collection. A baron bailie of St. Anthony's, who combined in his person the soldier, monk, and magistrate, was also elected by the session; but this office ceased to exist after the passing of the Burgh Reform Bill of 1833. During the siege of Leith by the Lords of the Congregation, it is recorded in the "Histoire of the Estate of Scot," that on April 15, 1560, some "Great Ordinance," placed on Mount Somerset (Giant's Brae), shot down St. Anthony's steeple upon which the Frenchmen had placed "artillerie which was very noisome to the campe." Another historian states with regard to the Preceptory that after an unsuccessful assault on the walls of Leith, the French stripped the bodies of the slain and exposed them on St. Anthony's blockhouse, at which "the Queen (Mary of Lorraine) hopped for mirth, and said, 'Yonder is the fairest tapestry that ever I saw.'" St. Anthony's Chapel on Arthur Seat is supposed to have belonged to the Preceptory at Leith.

Few persons going down the Shore of Leith ever give a passing thought to the old tenement now well known to the police as "No. 10 Coalhill;" nevertheless, mean as it is now, it was once the council chamber and headquarters successively of the Earls of Lennox, Mar, and Morton, who in turn occupied the position of Regent in Scotland. A branch street off the main street of the scheme will remove this tenement. Dr. Robertson states "that this building is even now (1851) not so inferior in external decoration as to make it in any way contemptible to the antiquarian observer." "I have compared it," he says, "with Lady Stair's celebrated house and others in the High Street of Edinburgh, and have little hesitation in giving it the preference. It is now to be seen in the same condition in which it was in 1835, when its interior, although divided and subdivided, still gave indications of former grandeur, sufficiently artistic to induce admiration." The tenement is at present filled with squalor and misery, but evidence of its "bright and palmy days" may still be discovered. One of the windows with an arched top bears the date "1678" cut out of the stone, with the letters "R I" or "R L" surrounded by a thistle, beneath. The "Peat Neuk," or Parliament Square, at the back of this building, has some ornate cornices believed to have been executed in 1775 by the orders of a shipmaster named Maclure. If a visit is next paid to some of the closes which will be entirely swept away by the improvement scheme, the antiquary will be rewarded for the momentary discomfort he may experience in finding some "sermons in stones," either inserted in the wall or forming portions of ancient doorways or windows. One is often struck with the massiveness of the walls of some of the houses in this quarter. In Merrilees Close, which is all but deserted by its inhabitants, one old tenement has walls from 3½ to 4 feet thick, making the small windows more like telescopes through which to see the light than

apertures to admit it. The ruinous condition of many of the roofs, with loose tiles and stones peeping over as if ready at any moment to topple down upon the unwary, renders it a matter of some danger to make a prolonged stay in these narrow and dirty closes. Above the entrance to Smeaton's Close, from St. Andrew Street, is a large stone forming the top of a window, with the words in rough capitals, "The Feir of the Lord is the beginning of al visdome." An occupant of the house has, however, carefully covered it with paint of a bright red colour, probably with the benevolent intention of calling the attention of the passengers to this relic of antiquity. Inside the close a stone is inserted in the wall of the same building, and bears, in characters of a similar formation, the words, "Feir the Lord. 1688." In Meiklejohn's Close, now pulled down, the lintel of an old doorway had inscribed upon it, "The Blessing of God is grit riches. M.S. 1609." There is a large tablet in a wall in Vinegar's Close bearing the names "Hendry Smith" at the top, and "Agnes Gray" at the foot. A design in the centre in alto-relievo can still be traced. It consists of a shield with a lion on the one side and a rude cross on the other, surmounted by a helmet, with a visor, and the whole surrounded by an ornamental scroll. The close evidently took its name from a vinegar work once carried on there, as the proprietor held a deed dated 1725, signed by Agnes Gray, widow of Henry Smith, vinegar maker. In a case before the Court of Session the tablet, which is supposed to date about 1700, proved the right of the proprietor to a well which was believed to have formed a portion of the vinegar work nearly a century ago. Such are a few of the mementoes of a bygone day, now being swept away to make way for dwellings more in harmony with the sanitary requirements of the present time. In taking down the old buildings some interesting relics will possibly be brought to light, and the local authority, with commendable forethought, have imposed a condition upon all contractors to safely remove all sculptured stones or relics of any description to the town's yards for preservation.

THE INFLUENCE OF INIGO JONES ON ENGLISH ARCHITECTURE.*

THE English system of house-building really began with the Saxon hall, consisting of a single apartment 30 or 40 feet in length, and about 15 or 20 feet in breadth, with a height disproportionately small. This apartment (the common hall) formed a centre around and from which the subordinate apartments grew, and it is curious to find that this feature has been retained throughout the whole of the mediæval period in England. Following the Saxon, we have the Norman castle, then the thirteenth-century manor house, in which the domestic arrangements were somewhat developed, while the defensive qualities were decreased. The hall, with its minstrel's gallery and raised dais, increased in magnificence and importance up to the fifteenth century, when it gradually changed its original use. Hitherto it had served as a general dormitory as well as a dining-room, but now that sleeping accommodation was becoming much improved amongst the better class of people, it was more and more the comfortable custom to retire to a special bed-chamber, assume a night-dress and sleep in a soft feather bed. In this way fresh rooms and apartments came into existence to meet the growing wants of the English people. A rough diagram which I have will illustrate the quadrangular plan on which the most characteristic houses were erected. You will notice that this example has no corridors; a number of exterior doors towards the court, and of internal doors for intercommunication between the rooms, constitute a very awkward substitute. The hall, with its screen and porch, forms the nucleus of the plan—on one hand are the offices, and on the other the family rooms. Hengrave Hall, Suffolk, is an example of the quadrangular plan, with corridors on three sides of the centre court as a means of communication. During the sixteenth century the common hall diminished in importance and in some instances actually disappeared. In small houses where servants were few, by the time of Elizabeth, a family parlour is considered to have been a most frequent substitute, the domestics being accommodated in the kitchen, whilst in many of the larger establishments a dining chamber accommodated the family and an inferior hall the servants.

We now come to the period of Coleshill, the seventeenth century. Here came a great change, not a development of anything which had preceded it in England, but a style both externally and internally foreign to English habits and customs. It will be appropriate here then (having briefly followed the development of the English houses to this time), to glance at the life of Inigo Jones, to whom we are indebted for the introduction of this new style to our country. He was the son of a cloth-worker, and was born about 1572. We are told that he was apprenticed to a joiner, in which position he was discovered by the Earl of Arundel, or by William Earl of Pembroke, and one or other of

* A paper read by Mr. Charles S. Smith, A.R.I.B.A., at the meeting of the Berkshire Archaeological and Architectural Society at Coleshill House.

these noblemen sent him to Italy, rather however, according to Walpole, to study the art of painting than that of architecture, for the former of which he says Nature seems to have fitted him, inasmuch as "he dropped the pencil and conceived Whitehall." Of his employment as an architect, nothing can be traced previous to the visit of James I. to the University of Oxford in 1605, when "the University hired one Mr. Jones, a great traveller, who undertook to further them with rare devices," but performed little to what was expected; he had 50*l.* for his pains. At Venice he became acquainted with the works of Palladio, and there gained so great a reputation, that Christian IV., King of Denmark, appointed him his architect, though of the buildings erected by him in Denmark we know nothing. In this country's capital, however, he was found by James, and by his Queen (Anne) was removed from Copenhagen to Scotland as her architect. By Prince Henry he was employed in the same capacity, and about this time had the grant in reversion of Surveyor-general of public works. On the death of the Prince he again visited Italy, where he perfected his taste and ripened his judgment. It appears more than probable that it was previous to his second journey that he designed those of his buildings which partake of a bastard style. These buildings are such as could, however, only have been designed by a great master in a state of transition from one style to another; such, for instance, are the north and south sides of the quadrangle of St. John's College, Oxford, in which he seems (says one) to have copied all the faults of his great master Palladio; still the composition is so picturesque that we can only admire it. After his second visit to Italy in 1612, he was appointed Surveyor-general to the royal buildings by James I., and was employed to prepare designs for a new palace at Whitehall. The only part of the design executed was the banqueting hall, which we have pride in quoting as one of the finest works of its kind in Europe. It was begun in 1619, and finished in two years. In 1632 Jones was employed on Somerset House, to the garden front of which he executed an elevation of singular beauty, lost to the world by its demolition on the rebuilding of the edifice for its present purpose. In 1620 he was employed by the king to investigate the origin of Stonehenge, when he came to the absurd conclusion that it had been a Roman temple. He was also one of the commissioners for the repair of old St. Paul's, and in 1633, Laud, then Bishop of London, laid the first stone of this work, and Inigo Jones the fourth. Jones was by this time too much disinclined to Gothic to bend his genius to anything in the shape of a restoration, and though the Roman portico which he placed before the church was magnificent, the application of Roman to Gothic architecture greatly deteriorated from the effect of that part of the cathedral. Jones's works were exceedingly numerous; many, however, are assigned to him which are the production of his pupils. Such buildings as Queen's House at Greenwich, Shaftesbury House in Aldersgate Street, the church of St. Paul, Covent Garden, and this very house, Coleshill, are strong proofs of the advance of architecture during his career. York Stairs is also attributed to him. After the Civil War, Jones was, we are told, compelled to pay heavy fines as a courtier and "malignant," and he, like many a talented man, died in poverty in 1652.

In very briefly speaking of the change in design which had taken place, the rough diagram of Stoke Park, Northamptonshire, will be useful as an illustration. Nothing could be more decidedly a revolution than the change in arrangement which this illustrates. The old English quadrangular model (to which I referred before) was made obsolete, and the new one was that of an Italian villa. Under the old system a larger variety of apartments were grouped together without much regularity of disposition, the chief dwelling-rooms and the offices forming the ground storey and the sleeping-rooms constituting the floor above. The new model, on the contrary, as a rule elevated the house on a complete basement, composed of the whole of the offices, the principal floor constituting the family dwelling-rooms, and one storey above containing the bedchambers. The old mediæval hall was entirely abolished; upon quite another principle there was formed a central saloon reaching in height to the roof of the building, lighted from above and surrounded by apartments. Instead of the comparatively trifling Elizabethan porch, there was a majestic portico of columns, with a broad ascent of steps; and whether the design was large or small, there was no longer any toleration of irregularity or picturesqueness, but the whole building must be massed into an imposing composition. Sense of grandeur was the first consideration, and convenience and comfort decidedly secondary. How different externally, too, were these severe Italian houses, with their formal porticoes, horizontal entablatures, and projecting cornices, crowned by parapet or balustrade to conceal the roof, to the picturesque irregularity of, say, Mappedurham House, with its pointed gables, tall roofs, decorated chimney shafts, and general careless happiness of design. The great aim of Palladian architects was perfect symmetry coupled with stateliness of design. Undoubtedly the formal terraces and villas of the early part of this century which constituted a large proportion of our better-class street architecture is a development of Jones's work. These unfortunately have been identified with cement facing and sham construction, and thus unhappily imitators of a brilliant genius have in many cases

brought discredit on a style which originally possessed very much real beauty. But whatever our ideas of Palladian architecture in England in its original form may be, none doubt that it has created an influence which, to-day, has perhaps more vitality than ever. With the recent revival of Classic work in domestic architecture has come a longing amongst large numbers of people for artistic decoration in the houses, for simple and beautiful forms in furniture and articles of everyday use. I am sure you will agree with me when I say, in conclusion, that our chief aim to-day in studying the history and examining the relics of the past is the improvement of the present and future. We do not intend to work with the servile hand of the copyist only; our aim shall be, with due regard to the changes of customs and manners, to the difference of climate and the conditions of modern society, to adapt the art work in our homes and public buildings, so that they may be beautiful and suitable, while bearing the impress of the best features of the past.

MEANS OF EGRESS FROM PUBLIC BUILDINGS.

A REPORT has been prepared by Mr. Turnbull, the Master of Works in Greenock, which contains the results of measurements of the churches and halls in the burgh.

The number of buildings examined was 79, and of these 36 are churches, 21 halls in connection with churches, and 22 miscellaneous halls. The points noted were: 1. The capacity of the buildings. 2. The width of doors. 3. The direction in which they open. 4. The position of the gas-meters. 5. Any other points calling for remark. And from these data Mr. Turnbull has calculated—1. The width of door-space available for exits in proportion to the number of persons in the building; and, 2, the time in which the building could be emptied, allowing about 18 inches by 18 inches for each person, and supposing the stream of people to move out at the rate of one mile per hour. Out of 79 churches and halls it was found that in 53 cases, or 68 per cent., the outer doors open inwards; in 14 cases, or 18 per cent., they open both ways; and in 11 cases, or 14 per cent., the doors open outwards. There are great variations in the proportion of width of door space to the capacity of the halls, running from one foot to every 25 persons to one foot to every 152 persons. In a hall in East William Street one foot to every 25 persons is allowed, the doors open both ways, and the hall could be emptied in about one minute; and in St. Andrew's Free Church the proportion is one foot to 29 persons, all the doors open outwards, and the church could be emptied in about one and a half minute. The following abstract shows the ratio of door space to capacity of the best known and most frequented public halls in Greenock:—

	Capacity about	Proportion of door space to capacity	Probable time required to empty hall
Town Hall	2,500	1 foot to 78 persons	3½ min.
Temperance Hall	900	1 foot to 121 "	4½ "
St. George's Hall	700	1 foot to 67 "	3 "
Theatre Royal	1,800	1 foot to 120 "	4½ "
Queen's Rooms	500	1 foot to 83 "	3½ "
New Assembly Rooms	500	1 foot to 130 "	5 "

It has been stated that the large Mormon Hall in Salt Lake City has exit doors to the extent of one foot to 25 persons; and while it might be too much to expect this as a general rule, yet one foot to every 50 persons would be a fair and reasonable proportion. If this proportion were adopted it would allow any hall, however large, to be emptied in about two minutes, provided all the doors, passages, and stairs were suitably arranged.

TOWN IMPROVEMENTS.

Teignmouth.—Public baths, lately constructed, have been opened at Teignmouth. The buildings contain on the ground floor waiting-room, office, invalids' bath-room, and apartments for attendants; and adjoining is a larger swimming-bath, 45 feet by 27 feet, with dressing-rooms, &c. On the first floor are two bath-rooms for ladies, and two for gentlemen, and attendants' bed-rooms. In the basement is a boiler-house, with other offices. The base of the building is of red brick, with the superstructure of buff bricks from the Chudleigh Road Potteries, relieved with red brick and Beer stone dressings. The buildings are supplied with salt water, obtained direct from the sea. The contractor was Mr. E. Andrews, of Teignmouth. The gas-fittings, engine, boilers, hot and cold water apparatus, &c., were supplied by Messrs. Andrews & Burden, of Teignmouth. Messrs. J. W. Rowell & Son, of Newton Abbot and Torquay, are the architects.

New Market Buildings.—A new market has also been opened. It is erected on the site of the old one, and in connection with it are two spacious offices for the use of the Local Board, the magistrates, &c. The outer walls are composed of red brick, set off by a free use of Beer stone in the way of dressings. The architects were Messrs. Rowell & Son, of Newton Abbot and Torquay, and the builder was Mr. H. Phillips, of Exeter. The cost of the building is about 4,000*l.*

LEGAL.

Queen's Bench Division.—June 25.

(Before Mr. Justice MATHEW.)

CORRIE v. REDDIN.—AN ELIGIBLE BUILDING SITE.

This was an action for nuisance. The plaintiff, the Rev. Edgar Corrie, stated that he had an estate in fee simple on the south side of the Grand Surrey Canal, in St. Giles's parish, Camberwell, subject to a lease for years, from which, however, the gravel, clay, or sand, or minerals were reserved and excepted; and that the lease had become vested in the defendant, but excepting the gravel, clay, or sand, &c.; and that he in 1879 had entered into possession, and had afterwards proceeded to excavate and remove large quantities of earth in or under the land; that his excavations formed a large pit in the land many yards square; and that he had removed the earth out of it for a great depth, and had got many thousand cubic yards of sand from it, and had sold the gravel and earth or applied it to his own use, and had received large sums of money for it; and further, that after thus excavating the pit he—carrying on the business of a scavenger—had brought large quantities of night soil and other filth and refuse and rubbish upon the land, and filled the pit with it, so that it would be impossible to build any houses upon it or otherwise to use the site of the pit while it thus remained full of filth. And so the plaintiff claimed an injunction, and also an inquiry as to damages. The defendant denied an assignment of the lease, but admitted a sub-lease to him of the land for a long term not ending until 1939, and also that he had removed some of the sand or gravel, but he denied the excavations alleged; and while he admitted that he had made an excavation and filled it up with rubbish, he denied that he had filled it with such refuse and filth as alleged, and he denied the injury alleged.

The plaintiff's case was opened, and evidence given in support of his case, and it appeared that the refuse put into the pit included not only dung, but hospital refuse, &c. Evidence was also given as to the deleterious nature of the refuse, especially with reference to the houses that might afterwards be built upon the site; and it appeared that the defendant himself proposed to build houses upon it.

On the part of the defendant the extent of the pit was disputed, but no evidence was given to controvert the case for the plaintiff in substance, as it was proved, and the defendant himself was not called.

The learned Judge gave judgment in favour of the plaintiff. As to the claim for damages, he said it was really undefended, and it was only a question of amount. The case for the plaintiff was that there had been a deliberate invasion of his right of property, and really as to that there had been no defence, and the only dispute had been as to the extent of the injury or damage done. Taking the figures brought before him he came to the conclusion that the damages awarded should be 2,000*l.* Then as to the injunction. What the plaintiff claimed was a mandatory injunction to the defendant ordering him to remove the filth and refuse from the excavation, and as far as possible to restore the soil, and the case for plaintiff was that as the leases reserved or excepted the soil under the surface the defendant had in taking it away violated the plaintiff's rights, and committed a trespass, and had inflicted a further injury by filling up the excavations with filth and refuse. And certainly the stuff put in was of the foulest character. To call the pit a dungheap would really be a moderate and, indeed, a flattering phrase. And then it appeared that it was intended to build houses upon the site, and the medical evidence was clear that dwellings built upon such a soil would be mere pest-houses, and that no persons could live in them without injury to their health and serious risk to their lives. On the part of the defendant it was contended that as the surface was devised to him for a long lease, which would not come to an end until 1939, there was no practical grievance to the plaintiff until then, and that the measure of damages would be the amount of the expense which would be incurred by the restoration of the soil, and that the payment of it should be reserved as a security until the expiration of the lease. But the effect of this would be that the defendant, at the expense of a few shillings, would be enabled to take the property of the plaintiff against his will, and inflict injury upon him with impunity. The Court could not be asked in such a case to impose upon the plaintiff—the owner—the terms of a compulsory purchase of his property against his will and without his consent. It had often been held that a trespasser or wrong-doer had no right to call upon the Court to place the owner in such a position. If the mere expense of restoring the soil were all that could be awarded the plaintiff would have no security for its being restored, as he would have no means of effecting the restoration, the defendant being in possession and having the power of preventing it. Moreover, in the meantime there might be complaints of neighbours or the risk of interference by the sanitary authorities. It was not right that the plaintiff should at the instance of a wrong-doer be placed in such a position. The Court in such a case had full power to award an injunction as asked for, and an injunction accordingly would be granted, its terms to be arranged by counsel, with leave to apply to the Court, if necessary, to settle them.

Worship Street Police Court.

(Before Mr. HANNAY.)

THE METROPOLITAN BUILDING ACT AND GOVERNMENT BUILDINGS.

On Tuesday Mr. Hannay gave his decision on the case raised by the Metropolitan Board of Works on their summons against Her Majesty's Commissioners of Works and Public Buildings for nonpayment of 1*l.* 2*s.* 3*d.*, fees paid to a district surveyor for work done. The summons was before the Court a fortnight ago, when it was shown that a lodge in Victoria Park had been condemned by the district surveyor in consequence of its dilapidated state. The fee claimed, and paid by the Board, was due under the Metropolitan Building Act (Dangerous Structures), 1855, but for the Commissioners it was contended that the exemption in Part I. of the Act, which mentioned royal palaces and any building occupied for Her Majesty's use or service, included such a building as the lodge in question. The Metropolitan Board contended that Part II. of the Act, under which the summons was taken, contained no exemption. Mr. Hannay, in giving judgment, said it was generally understood that the royal palaces, great public buildings such as the Bank of England and other places, were exempt from the minute provisions made for the care of the ordinary class of house property. Other provisions of the statute again were quite impossible of application to Crown property. The 73rd, 74th, and 80th sections of the Act went beyond prerogatives, and he considered that the argument for the Commissioners that the exemption of Part I. applied by implication to the whole of the Act was overpowering. He had come to the clear conclusion that Crown property was not included within the operation of Part II. of the Act, and should, therefore, dismiss the summons, but would grant a case, if desired. Mr. Bevan, for the Board of Works, asked if he might take the decision as meaning that the Board had no jurisdiction over Crown buildings? Mr. Hannay said that in some cases the Act gave them jurisdiction, but the Commissioners of Works had surveyors of their own, who were responsible for the safety of the buildings belonging to the Crown.

Manchester County Court, June 22.

(Before Mr. J. A. RUSSELL, Q.C., Judge.)

DWYER v. BATES.

THE EMPLOYERS' LIABILITY ACT.

This was an action under the Employers' Liability Act to recover compensation for injuries sustained by a workman in consequence, as he alleged, of the negligence of his employer. The plaintiff was employed by the defendant, at the end of last year, as a bricklayer's labourer in the erection of offices for Messrs. Beyer, Peacock & Co., at Gorton. Owing to a severe frost the works were stopped for about a fortnight, but on December 18 the working foreman told the plaintiff and other labourers to take up bricks and mortar upon a scaffolding in order that the bricklayers might proceed with their work. Several hod-loads of bricks were accordingly taken up, when a put-log broke, and the plaintiff and other men were thrown to the ground. The plaintiff was removed to the Royal Infirmary, where it was found that he had sustained a severe shock, that several of his ribs were broken, and that he was cut and bruised and otherwise injured. He remained in the infirmary a fortnight, and was subsequently an out-patient for six weeks; but he did not now feel that he had quite recovered, and he was unable to do the work which he had previously performed. It was contended in support of his case that the scaffolding was not properly constructed, inasmuch as the timber used for the put-log having knots in it was not fitted for the purpose for which it was employed, and also that after the frost the scaffolding should have been carefully examined before the labourers were allowed to go upon it. The plaintiff and a number of witnesses having given evidence, the Judge said that to bring the employer within the sections of the Act, it must be shown that the defect in the machinery or plant was one which was apparent to the eye, or which would be discovered upon a careful examination. It was not contended that the defect in this case was apparent, or that anybody upon examination could have seen it. Again, although it had been proved that there was a mode of testing such portions of scaffolding, it had not been proved that the timber was not actually tested. He did not think, considering the whole of the case, that the timber had been broken under such circumstances as would make the defendants liable under the Act, and therefore the plaintiff would be nonsuited, without costs.

Rotherham County Court.—June 22.

AXLEBY v. KEIGHLEY TIMBER COMPANY.

ARCHITECTS' FEES.

The plaintiff in this case is an architect living at Masborough, and he sought to recover the sum of 24*l.* 17*s.* from the defendants for fees. The claim was made up as follows: 22*l.* 1*s.* for attendance as witness on behalf of the defendants in an action which was heard in the Isle of Man; 1*l.* 16*s.* for railway and boat fare; and 1*l.* the value of an ivory rule, which had since been returned. The defendants had paid into court 4*l.* 3*s.* The plaintiff left his home

to attend the trial on Thursday, April 12, of the present year, and reached his home on his return after the trial late on the following Wednesday night. The defendants had offered him 4s. per day, but he claimed three guineas per day, first class railway fare to and from Liverpool, and boat fare to and from the Isle of Man.—The plaintiff said that last year he acted in the capacity of manager for Mr. Lightfoot, who was erecting a theatre and hotel at Douglas. The defendants had a contract for supplying some staircases and railings, &c.—Cross-examined: About two years ago he held a publican's license, but when he held that he practised as an architect. Mr. Lightfoot paid him 2*l.* a week, but in addition to that he hoped to receive commissions from the parties who supplied his employer with goods. He thought he acted honestly in that matter.—For defendant it was said that prior to the action the defendants had no idea that Mr. Axleby had ever been an architect or was entitled to call himself such. They dealt with him and treated him on the basis that he had been a foreman in the service of Mr. Lightfoot, and he was called to prove facts which were within his knowledge in that capacity. In the island the plaintiff offered to take 5*l.* in settlement of his claim, and after his return he sent to the defendants a claim for 10*s.* per day and hotel expenses at the rate of 7*s.* 6*d.* per day. His Honour, in giving judgment, said with regard to the first part of the claim, three guineas per day for seven days, he must say that he was astonished how anybody of honesty or intelligence could frame such a claim upon the circumstances which had been stated in evidence that day. An architect engaging himself in another capacity could certainly not be allowed to throw off the cloak for the first time when he was going to make a charge for his services. The claim of three guineas per day was absurd, and he must reject it entirely. At the same time he considered the plaintiff was entitled to a more liberal allowance per day than he received when in the service of Mr. Lightfoot—viz., 7*s.* 6*d.* a day, with expectations of what he called commissions, and which, if he had got, would by all the rules laid down on the subject, belong to his employer. He considered the plaintiff was entitled to 10*s.* a day for six days, and his verdict would be for 6*l.* (including 2*l.* 5*s.* hotel expenses), with court costs only.

Court of Session, Edinburgh.—June 23.

GORDON v. RAE.

REMOVING TREES NEAR HOUSES.

This was an action between the heir of entail of the Barony of Ellor, Aberdeenshire, and the defender, John Rae, jun., a merchant there, and one of his leaseholders, in regard to the latter's right to clear the ground surrounding his cottage of trees. The defender averred that the trees were detrimental to the cottage from the dripping of rainwater upon the roof, and that their proximity, according to the view of an architect, was injurious from a sanitary point of view. The defender had cut down four trees, and maintained his right to cut down as many as he considered necessary for the amenity of the cottage, while the pursuer sued for declarator of his right, 100*l.* damages, and interdict.

Lord Fraser said that there was no justification for the defender cutting down these trees at his own hand and pocketing the price, with the exception of a mountain ash which he appeared to have given to conciliate a minister of the place. The trees might have needed pruning; but that should have been done, and had been done, by the proprietor. The defender had paid too much attention to the advice of an architect, who, like many other ignorant people, was of opinion that trees were more a nuisance than an ornament. His Lordship found and declared for the pursuer, found him entitled to 10*l.* as the value and damage done by defender to the trees, and interdicted him from cutting any of the timber on the ground, but reserving to him all rights on obtaining the sanction of the proprietor or a court of law on sanitary grounds. Pursuer was found entitled to expenses.

ARCHÆOLOGY.

Sculptured Stones.—Four stones, bearing emblems, have been discovered in or about the parish church of Chester-le-Street. The first consists of three panels, the central one containing a finely-cut and noble cross complete, another face bears a dragon and other figures, whilst the third is a fine representation of a man embracing or contending with a figure which, being broken off, cannot be defined. This and the following stone were found in the corner of the south wall of the chancel. The second stone likewise consists of three panels illustrated with various subjects, and having a sunk well at the top, which leads to the opinion that it formed the base of a cross. The third is a large slab, resembling a grave cover. This stone was found in the loft near the bell tower, where alterations are now being made. The cover bears a cross in the centre, a sword on one side, and a spear on the other, boldly and clearly cut. A fourth stone, and probably the most interesting of those yet found, was discovered in the east end of the chancel wall immediately to the rear of the altar. It is about a yard long and broken at one end. It had been used as a building stone, the blank side of it being outside. On the dressed face at the upper end are the letters E A D in Roman capitals

(the first bishop being Eardulph), but there is no date. Underneath there is a fine figure of a man on horseback, both being clearly defined, whilst above the horseman is a canopy. The bottom portion consists of a quantity of Saxon tracery.

St. Stephen's-by-Launceston Church.—An interesting discovery has been made at this church, which is being restored under the direction of Messrs. Hine & Odgers. In removing a modern granite window at the east end of the chancel, and preparing for fixing a five-light window of polyphant stone, a large sculptured stone was found in the middle of the wall, representing Christ in Majesty. The figure is seated. The right hand is upraised, and the left rests on a book. The nimbus includes a cross. As much of the figure as is represented is life-size. The stone, answering somewhat to polyphant, is similar to that used in the fourteenth-century portions of the edifice. There has been some discussion as to another sculptured stone on the exterior of the same wall of the chancel. It is much mutilated, but there is little doubt that it represents the Virgin and infant Saviour, and it forms the tympanum of a blocked-up doorway on the north side of the altar. On the south side of the altar are the remains of another doorway, and beyond the end wall of the chancel eastward are the foundations of what was either a sacristy or (more probably) a lady-chapel, into which the two east doorways opened. There can be little doubt that the Christ in Majesty occupied a place above the south doorway—corresponding with that of the Christ in Humility above the north doorway—and it is intended to refix the recovered sculptured panel in that position. Other interesting remains have been brought to light, which will be carefully preserved.

Old Augsburg Frescoes.—An interesting discovery was made recently at Augsburg in the course of carrying out some extensive repairs at the Protestant church of St. James. In the process of taking down the old organ some of the neighbouring surface plaster became detached from the wall, and it was then found that beneath several coats of whitewash, old and modern, there were hidden some very beautiful large frescoes. Among the subjects are our Saviour, the crowning of the Virgin, St. James, St. Anthony. A stone inscription underneath, which also had been rendered invisible by the layers of whitewash, records that they were executed between the years 1480 and 1496. One of the pictures had been paid for by the patrician Welser. Artistic experts declare that these frescoes are precious memorials and specimens of the early Suabian school, and are of opinion that they were most probably executed by the immediate predecessors and teachers of those ornaments of Augsburg, Burkmaier and Holbein.

CHURCH BUILDING AND RESTORATION.

Bromsgrove.—The foundation-stone of a new Wesleyan chapel has been laid. The new building is designed by Mr. F. J. Yates, architect, Birmingham. The chapel will be 40 feet wide by 59 feet 9 inches in length, and, with the gallery, will provide accommodation for 450 persons. The schoolroom at the rear will be 58 feet long by 30 feet wide, and, with class-rooms, will provide for 300 children. The building will be of red brick, relieved by Bromsgrove stone. The builder is Mr. Benjamin Till, Mr. William Griffin carrying out the stonework.

Harrogate.—A Baptist chapel has lately been opened, and consists of chapel, two vestries, a lecture-room, class-rooms, and attendant's dwelling. The chapel has a nave (without aisles), transepts, and chancel, the latter containing the baptistery, beautifully constructed of white marble. The chapel is calculated to seat 650 persons. The architect is Mr. Wm. Peachey, York. The contractors are: Brick and stonework, Mr. M. Wilson, Headingley; slating, Messrs. Watson, Worsnop & Co., Leeds; plastering, Mr. Charles Fortune, Harrogate; plumbing and warming, Mr. S. Rushworth, Shipley; glasswork, Mr. Hodgson, Stonegate, York; painting, Messrs. Knowles & Son, Harrogate; stone-carving, Messrs. Thorpe, Leeds.

Hanley.—The new Tabernacle Church and buildings, Hanley, were opened on Thursday the 21st. The total cost is about 12,500*l.* The church itself has seating accommodation for 1,000 people. Its extreme length is 84 feet; width in the transepts 69 feet, and in the body 48 feet. It is provided with galleries on three sides. In place of the single-span roof the architects have introduced an arcaded nave-and-aisle arrangement, the uprights of which, of moulded teak wood, do not impede the sight, whilst equally distributing the load of the roof. Buildings contiguous provide all the accommodation likely to be needed by a large congregation. These include a lecture hall, containing seats for 200 people; a large schoolroom, library, infants' schoolroom, mothers' meeting-room, eight boys' class-rooms, five girls' class-rooms, and other rooms for various purposes. The architects are Messrs. William Sugden & Son, of Leek; the contractor, Mr. Samuel Warburton, of Manchester. Mr. Thomas Heywood acted as general foreman. The new organ is built by Mr. John Stringer, Hanley; the case is of pitch pine, designed by Mr. Sugden.

Washford Pyne.—The parish church of St. Peter, Washford Pyne, North Devon, has been partially rebuilt. It was a small

edifice, consisting of nave, chancel, and west tower. Owing to the state of decay nothing short of absolute rebuilding was practicable. The works completed embrace the entire rebuilding of the nave, the addition of a north transept, a new south porch, and also of rebuilding the upper part of the west tower. On the latter, which contains three bells, a low broached spire, covered with tiles, has been erected. The nave roof is of steep pitch, and covered with slates. In the apex of the porch is a niche into which it is designed to put a sculptured representation of the patron saint. The contractor for the general works was Mr. J. R. Gibbard, builder, of Exeter, and Mr. R. Medley Fulford, F.R.I.B.A., of Exeter, was the architect, from whose designs and under whose immediate supervision the work has been carried out.

NEW BUILDINGS.

A Palace of Delight.—On the Herreninsel in the Chiemsee, at the entrance to the Bavarian Tyrol, the King of Bavaria has been for the last six years building a palace-villa, which rumour says will surpass in splendour, comfort, elegance, and almost in artistic perfection, all the other royal residences in the world. The main building has been some time completed, including the great banqueting-room (which is 30 feet longer than that at Versailles), the reception-hall, and the State apartments. But additional buildings are being erected, the ornamental grounds are being enlarged or re-arranged continually, the system of water-supply is being improved or extended, so that it would be impossible to estimate when the work will be judged to be fully completed. Five hundred workmen are constantly employed from the beginning of spring far into the autumn. The principal building has been completely furnished. The resources of art have been taxed to the utmost, the very door handles and window fastenings being of exquisite design and workmanship. There is an abundance of beautiful wood-carving. And if the walls are not clothed with paintings like those in the Doge's palace at Venice, they are lined with most beautiful and costly marbles. The palace is not visible from any of the neighbouring roads or places accessible to the ordinary traveller, the site having been chosen so as to secure complete privacy. It is considered to be a pity it was not built on the ruins of the adjacent old monastery, whence it would have commanded a complete view of a glorious landscape.

New Bank, Edinburgh.—The directors of the Bank of Scotland, having acquired the property at the west side of the bank in George Street, plans have been prepared by Messrs. Kinnear & Peddie for the erection of more commodious premises, and operations are now in progress for the demolition of the old buildings. The new buildings will have a frontage to George Street of 66 feet. The street floor is to be occupied as the bank offices, the cellarage below being set apart for the storage of books, documents, &c.; while the two upper flats are to be laid out in suites of chambers. The entrance to the bank will be at the west end of the frontage, where there is to be a Doric portico with coupled columns, carrying an entablature and pediment, on which are carved the bank's arms and supports. Corresponding to these, at the east end of the street floor, will be the entrance to the chambers or offices; and between the two there are three large windows lighting the telling-room and the agent's private room, which measures 18 feet by 14 feet. These windows are 8 feet wide and 15 feet high to the top of the arch, and are divided by Ionic shafts in the centre, with pilasters at the sides carrying a light entablature at the spring of the arch, while the semicircular arch itself is divided by an ornamental carved pilaster. The whole of the street floor is executed externally in rusticated ashlar, and is finished at a height of 27 feet above the pavement by an enriched cornice. The first floor has five windows, which are ornamented by three-quarter Corinthian pilasters standing on pedestals, with balusters between, and supporting suitable entablature and pediments. The second floor has smaller windows, finished with moulded architraves. The front of the building is finished with a highly-enriched cornice and carved frieze, the two measuring 6 feet in height.

ENGINEERING WORKS.

Ovingham.—A bridge is to be constructed across the Tyne between Ovingham and Prudhoe, plans for which have been prepared by Mr. H. Laws, C.E., Newcastle. It will be an iron lattice girder bridge of eight spans, and its total length will be 530 feet. At the ends it will be supported by masonry abutments, while the piers in the river will be composed of wrought-iron piles. The foundation-stone on the north side has now been laid, and considerable progress made with the masonry on the south side. The contractor for the masonry is Mr. W. Wilson, of Gilsland, and the contractors for the ironwork are the proprietors of the Alliance Works, Darlington.

Funds are to be collected for the first portion of the enlargement of St. Michael's Church, Ipswich, according to the plans of Mr. E. F. Bisshopp.

GENERAL.

The Duke of Devonshire has given a large site for the erection of a church at Eastwood, near Keighley.

Mr. C. Groves has promised a donation of 4,000*l.* towards the proposed church of St. Polycarp, Everton, on condition a like sum is raised before long from other sources.

A Sailors' Home is to be erected in Leith at a cost of 8,600*l.*, from the designs of Mr. C. S. S. Johnston, of Edinburgh.

The Court containing Mr. C. Purdon Clarke's collection of Indian objects relating to house decoration in the South Kensington Museum will be opened to the public on Monday, July 2.

Sudbury Church is to be completed in memory of the late Lord Vernon.

Canon Fergie, the vicar of Ince, at a distribution of school prizes last week, commended the liberality of the people of Ince, and stated that 5,000*l.* had been promised to him for the building of a church, and 2,000*l.* for the erection of a school and other purposes, and that a few days since a gentleman had promised him another 5,000*l.*, making 12,000*l.* of unsolicited donations in a few weeks.

Plans for laying out the cemetery for Stoke-on-Trent, and the several works connected therewith, prepared by Messrs. Milner & Son, have been approved, and tenders for the work are to be obtained.

Messrs. Romaine-Walker & Tanner have been appointed architects for a new mission room in Farndale Road, East Greenwich, to hold 390 adults; and one in the Surrey Gardens district, to hold 600 adults.

The Conventual Buildings within the ruins of Diocletian's Baths, comprising Michael Angelo's fine cloister, hitherto occupied by the Military Administration, have been successfully claimed by the Minister of Public Instruction as a national monument, and will become the site of an antiquarian museum.

The Committee of the Incorporated Church Building Society voted away at their last meeting the whole of the available balance, both of the general fund and the missions buildings fund.

Professor von Angeli has been invited to visit England to paint a life-size portrait of Her Majesty, which is to be presented to the German Emperor in October next, on the occasion of the twenty-fifth anniversary of his assumption of the Regency of Prussia.

The Ancient Church of Barrow, near Chester, has been reopened, after a thorough restoration by Mr. Douglas, architect. About 2,000*l.* has been expended on the work. The earliest rector noticed in the register is "Osbertus Gyfford, Acolytus, 1313."

Messrs. C. Kite & Co., of 117 Chilton Street, London, N.W., were awarded at the recent Hygienic Exhibition two of the highest medals issued—one for their Chimney-breast Ventilator, and one for their Wall Inlet Ventilator.

Mr. G. F. Watts, R.A., has presented three portraits painted by him to the National Portrait Gallery. The first is of Lord Lyndhurst, at the age of ninety; the second is of Lord Stratford de Redcliffe; and the third is of Lord Lyons, who commanded the fleet during the Crimean War. Reynolds' portrait of Sir William Hamilton has been deposited in the gallery on loan.

The remaining Portion of the freehold building estate at Hendon, comprising about 15 acres, offered by Mr. Richard J. Collier (in conjunction with Messrs. Hussey & Walcott) at the Mart last month, and not then sold, has since been disposed of by private treaty at about 10,000*l.*

The Petition against Wells & Co., Limited, was on Saturday last dismissed with all costs. It was proved that the petitioner's debt was not due when the petition was presented, and that upon the day the debt matured the company paid the amount. The company's accountants gave satisfactory evidence of the solvency of the company, and the petitioner, Mr. Job Edwards, has made an ample apology.

The North Wales Slate Trade, which has been very dull for some time, many of the smaller quarries remaining closed, at last shows signs of general improvement, and at a meeting of quarry proprietors held lately it was decided not to enforce the contemplated reduction in the price lists. Short time is, however, threatened at the Llanberis quarries, and the Executive Council of the North Wales Quarrymen's Union are formulating a scheme to enable their members to emigrate, a sum of 2,000*l.* having been voted by the union for that object.

Herr Penther, the custodian of the gallery of paintings at the Vienna Academy, has discovered an Albert Dürer, which was catalogued as a Lucas Cranach. It had some time or other been subjected to a process of restoration, which had completely obscured the original. Herr Penther has been able to remove almost all the traces of this super-imposed work, and the underlying picture is, on the whole, well preserved. The subject is *The Dead Christ taken down from the Cross, lamented by the Holy Women*. It is on wood, and is 76 centimetres high by 56½ broad. Herr Penther has no doubt of its authenticity. The heads are evidently drawn by a master hand, and remind one at once of some undoubted pictures by Dürer in the Munich Gallery and elsewhere.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 30, 1883.

AND

CLEVELAND WORKS.

PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C.: April 9, 1880.

DEAR SIRs,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleaned, which I need hardly say is of great importance.

Messrs. FRANCIS & Co.

I am, Dear Sirs, yours faithfully,

HENRY CURREY, ARCHITECT.

Sole Manufacturers:—FRANCIS AND CO., VAUXHALL, LONDON, S.E.

TURNERY'S IMPERIAL CONCENTRATED
SIZE POWDER

FOR THE IMMEDIATE MANUFACTURE OF SIZE.

Specially prepared for the use of House Painters, Decorators, and Manufacturers. Celebrated for its purity and strength. Guaranteed free from anything calculated to injure Colour or Fabric.

This Preparation possesses the following advantages over ordinary Size:—

- 1.—It is cheaper, being equal to ten or twelve times its weight of Patent Size.
- 2.—It is more efficient, the Size made from it being more tenacious, and perfectly pure.
- 3.—It is more convenient, a Size of any strength, and in any required quantity, being made at any minute, thus saving time and waste.
- 4.—Will keep any length of time in a dry place, and is therefore never liable to become mouldy, or acquire a disagreeable smell.

This Powder supplies a want long felt by all users of Size, as it at once does away with the great inconvenience of the old method, and supplies a Size both cheaper and more efficient.

Packed in Cases containing 28, 56, and 112 1-lb. Packets. Samples, Prices, and Testimonials on application.

PREPARED ONLY BY THE ORIGINAL MAKERS,

W. J. TURNERY & CO., LEATHER, PARCHMENT, & GLUE WORKS, STOURBRIDGE.
